28 Degree Dipole for DANAE Experiment

Pasquale Iorio, Claudio Sanelli

1. Introduction

The DANAE dipoles are dimensioned with a bending radius bigger than the present DAΦNE one, then the magnetic field for higher energy beam can be reached using normal conducting technology with a magnet gap of 43mm. With such a gap the best solution is to have H shaped laminated dipoles. A C shape solution, with detachable poles to allow the coils mounting, would be very complicate from the mechanical point of view and, since the magnet must ramp up from 0,73 T to 1,718 T, the connecting bolts between various pieces of iron may represent a problem because of eddy currents. All the dipoles have the same bending radius but three different magnetic lengths. This document focuses on the 28 degree dipole with a magnetic length of 1,138 m at maximum field.

1.1. Specifications to be met

The following table contains all the requirements that the 28 degree dipole must satisfy.

Table 1 - Specifications for the dipole design

Bending angle [deg (rad)]	28 (0,4887)
Bending radius [m]	2,329
Magnetic length at maximum energy [m]	1,138 ± 0,001
Maximum field [T]	1,718
Minimum field [T]	0,73
Integrated strength [T·m]	1,9551
Horizontal good field region [mm]	-30 ≤ x ≤ +30
Field quality	1*10 ⁻³

The DANAE 28 degree dipole studied in this note will be trapezoidal like. The beam will enter and exit the dipole perpendicularly to the iron faces.

1.1.1. Definition of field quality

In the simulations a lamination profile that verifies the following condition has been requested

$$-1 \cdot 10^{-3} \leq \frac{B_y(x,0) - B_y(0,0)}{B_y(0,0)} \leq 1 \cdot 10^{-3}$$

at all field levels for $-30\text{mm} \leq x \leq 30\text{mm}$ and $y=0$ mm (2D coordinate system is represented in Fig. 1).

1.2. Profile description

1.2.1. Core description

The lamination profile used in the 2D and 3D simulations is shown in Fig. 1, while the coordinates of the points are reported in Tab. 2. The gap is 43 mm.

Table 2 – The table defines the geometry of the lamination profile used in the 2D simulations and the base plane of the 3D model.

Iron	X [cm]	Y [cm]		X [cm]	Y [cm]
A	-2,8	2,15	R	-30	19,15
B	3	2,15	S	-12,6	19,15

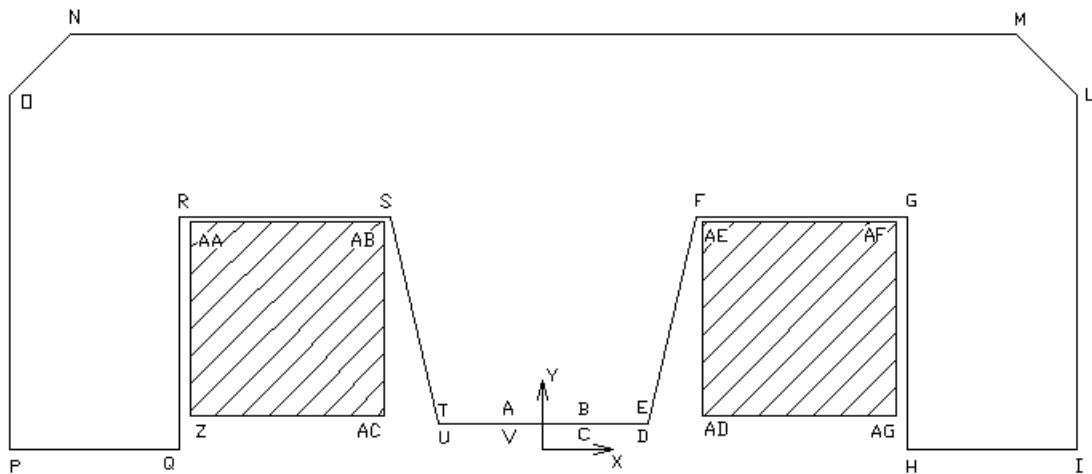

Figure 1 – Lamination profile of the DANAE 28 degree dipole used in the magnetic calculations. Exploiting the symmetry only half of the dipole has been modelled.

1.2.2. Coil description

The dipole coil is made of two 28 degree arcs, four 90 degree arcs and two straight bars made as can be seen in Fig. 5. The coil is composed of 8x8 turns of copper conductor whose cross section is $17,4 \times 17,4 \text{ mm}^2$ with a 9,3 mm diameter hole for water cooling. Nominal current at the maximum energy is 609,2 A while that for the minimum energy is 198A.

2. Magnetic Calculations Results

The 2D simulations have been performed with POISSON, the 3D magnetic study has been done by OPERA3D. All the files written for the simulations are enclosed in the appendices.

2.1. 2D Simulations

The following parameters have been used:

- Packing factor 0,96
- Mesh size 1 mm
- Minimum and maximum abscissa of the window in air ±80 cm
- Maximum ordinate of the window in air 60 cm

The field quality has been checked at 2 different reference fields that correspond to the two energy levels of the dipole: 1,718 and 0,73 Tesla. The B-H curve is shown in Fig. 2 and tabulated in Appendix I; the results of simulations are shown and explained below.

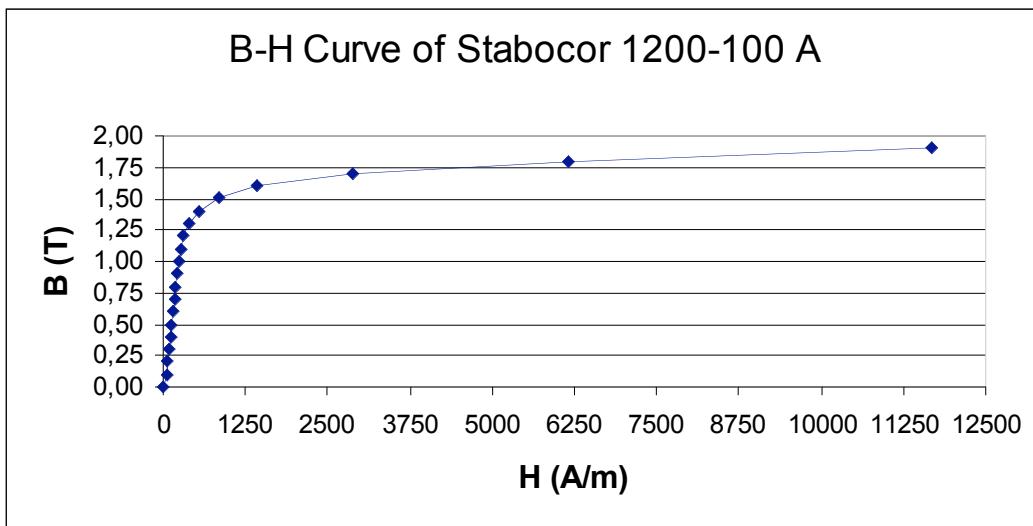

Figure 2 – B-H curve of the material used in all the simulations.

2.1.1. Computation results at $By(0,0)=1,718T$

Figure 3 shows the value of $\frac{B_y(x,0) - B_y(0,0)}{B_y(0,0)}$ as a function of the orizontal x coordinate for a current of 609,2 A.

The calculation is performed with $I = 38988,8$ Ampere*turn and a central magnetic field of $By(0,0) = 17370,69$ Gauss is obtained. The range of the field quality inside the good field region is:

$$-9,82 \cdot 10^{-5} \leq \frac{\Delta B_y}{B_y} \leq 9,12^{-4}$$

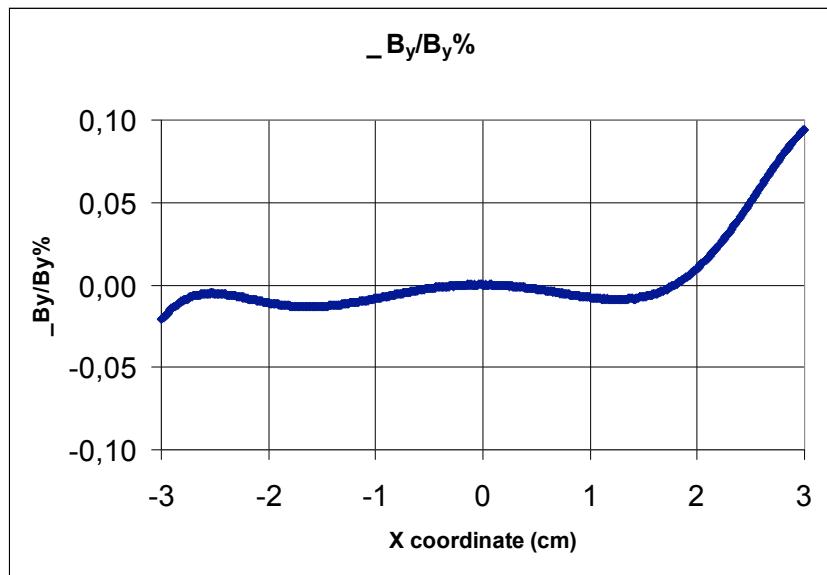

Figure 3 - Values of $\Delta B_y/B_y$ in the good field region for the current of 609,2 A.

2.1.2. Computation results at $B_y(0,0)=0,73T$

Figure 4 shows the values of $\frac{B_y(x,0) - B_y(0,0)}{B_y(0,0)}$ for $B_y(0,0) = 0,73$ T.

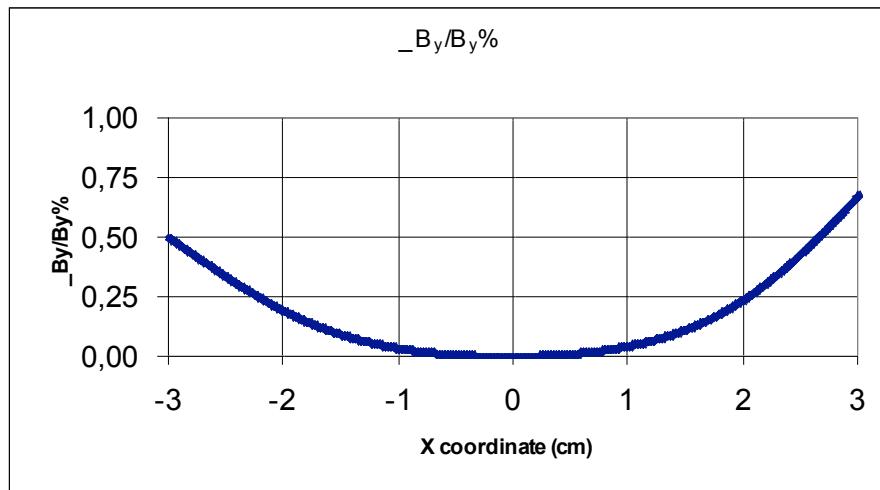

Figure 4 - Values of $\Delta B_y/B_y$ in the good field region for the current of 198 A.

The calculation is performed with $I = 12672$ Ampere*turn, corresponding to a current of 198A to which a central magnetic field and a central magnetic field of $B_y(0,0) = -7335,54$ Gauss is obtained. The range of the field quality inside the good field region is:

$$0 \leq \frac{\Delta B_y}{B_y} \leq 6,807 \cdot 10^{-3}$$

This simulation shows that the field at 198 A has not the required homogeneity of 10^{-3} or better.

2.2. 3D Simulations

2.2.1. 3D magnet model

The DANAЕ 28 degree dipole is a trapezoidal magnet; every lamination is shifted along the reference particle trajectory in such a way that the ideal particle should always pass through the centre of the lamination. The yoke mechanical length is 1,223 m, while the overall dimension (see section 3) with coils included is 1,614 m. The radius of curvature of the coil is 2,329 m. Figure 5 shows the 2D representation of the coil used in the simulation.

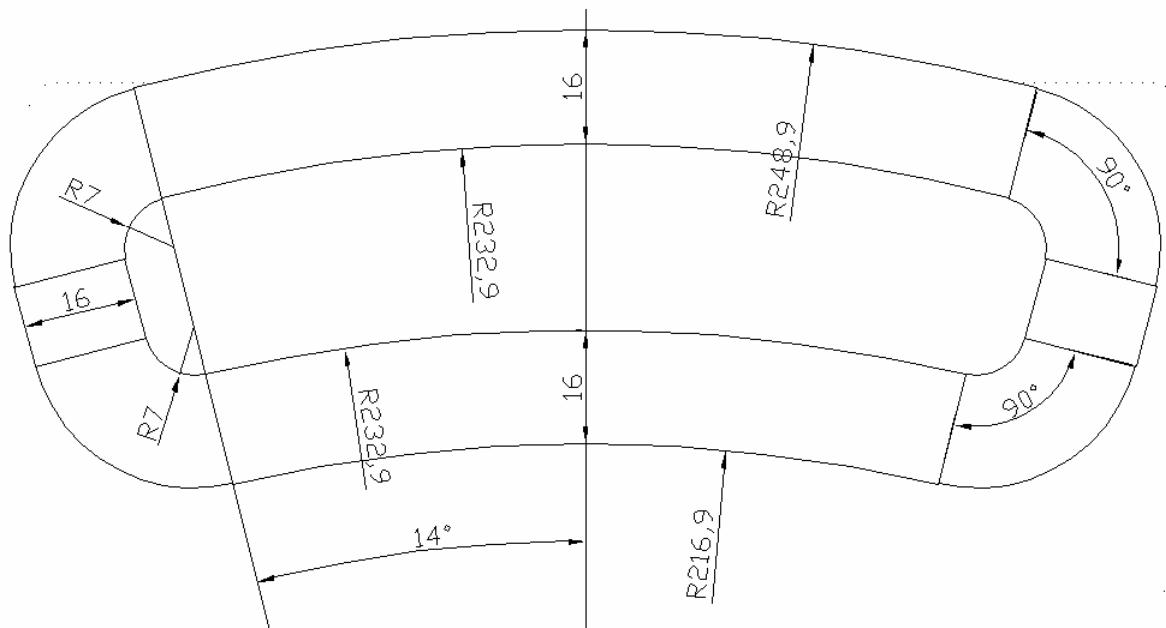

Figure 5 – 3D coil model used in the simulation.

In 3D calculations the coil inner and outer insulation is neglected, and the coil is represented as a single conductor of cross section $A \times B = 16 \times 16 \text{ cm}^2$ and with an overall current density of

$$J_{3D} = \frac{N \cdot I}{A \cdot B} = \frac{64 * 198}{16 \cdot 16} = 0,495 \text{ A/mm}^2$$

and of

$$J_{3D} = \frac{N \cdot I}{A \cdot B} = \frac{64 * 609,2}{16 \cdot 16} = 1,523 \text{ A/mm}^2$$

for low field (0,73 T) and high field (1,718T) respectively.

The permeability curve of the iron is the same used for 2D calculations (Fig. 2). The lamination effect is taken into account defining the material packing factor PF=0,96.

2.2.2. Computation results at $B_y(0,0)=1,718 T$

Figures 6 and 7 show the field homogeneity as it results from 3D simulations.

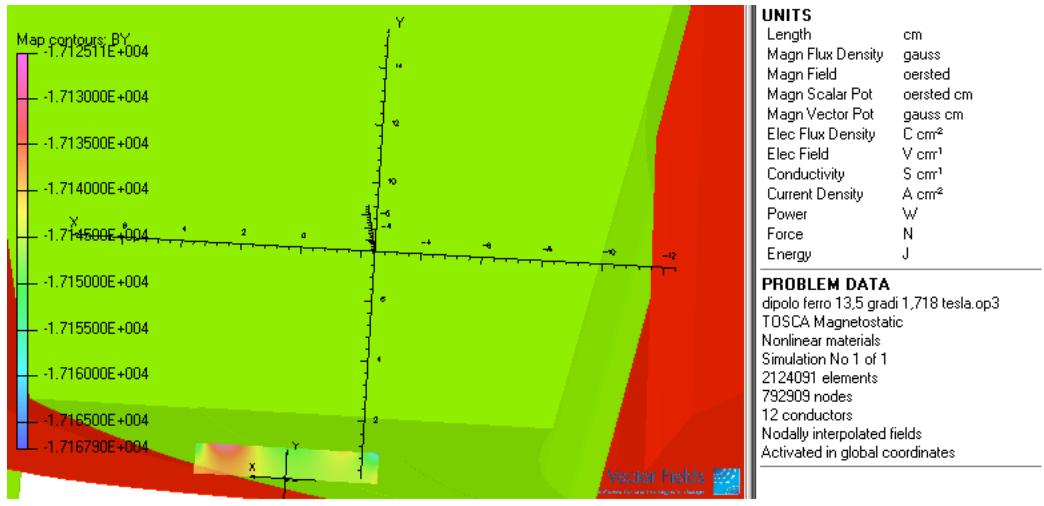

Figure 6 – Field homogeneity in the central part of the dipole. It is within the limits of $\pm 1 \cdot 10^{-3}$. The red part of the plot corresponds to the coil in a prospective view, while the green part is the iron yoke.

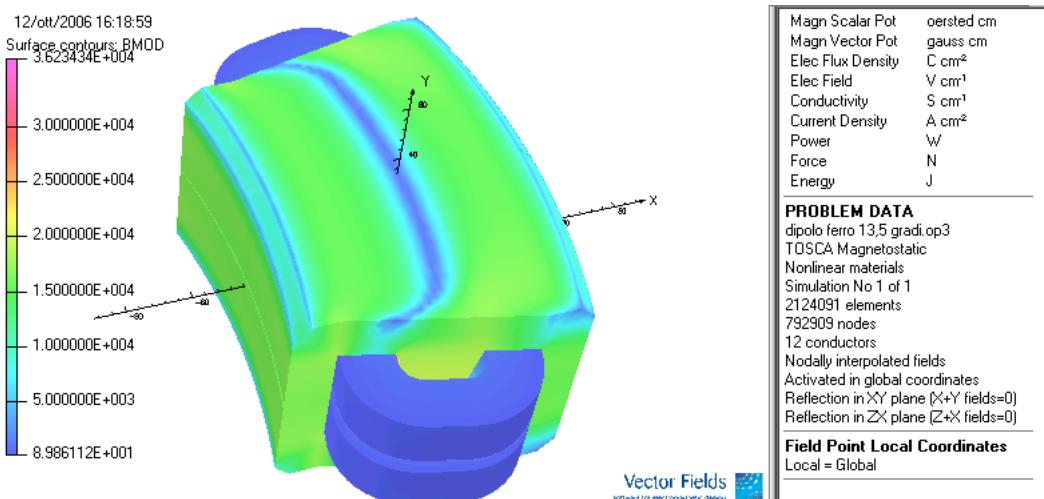

Figure 7 – Total field on the surface of the model.

The range of the field quality inside the good field region is:

$$\left| \frac{\Delta B_y}{B_y} \right| \leq 5,7 \cdot 10^{-4}$$

Figure 8 represents the plot of the field density B_y inside the good field region at the centre of the magnet as function of x coordinate.

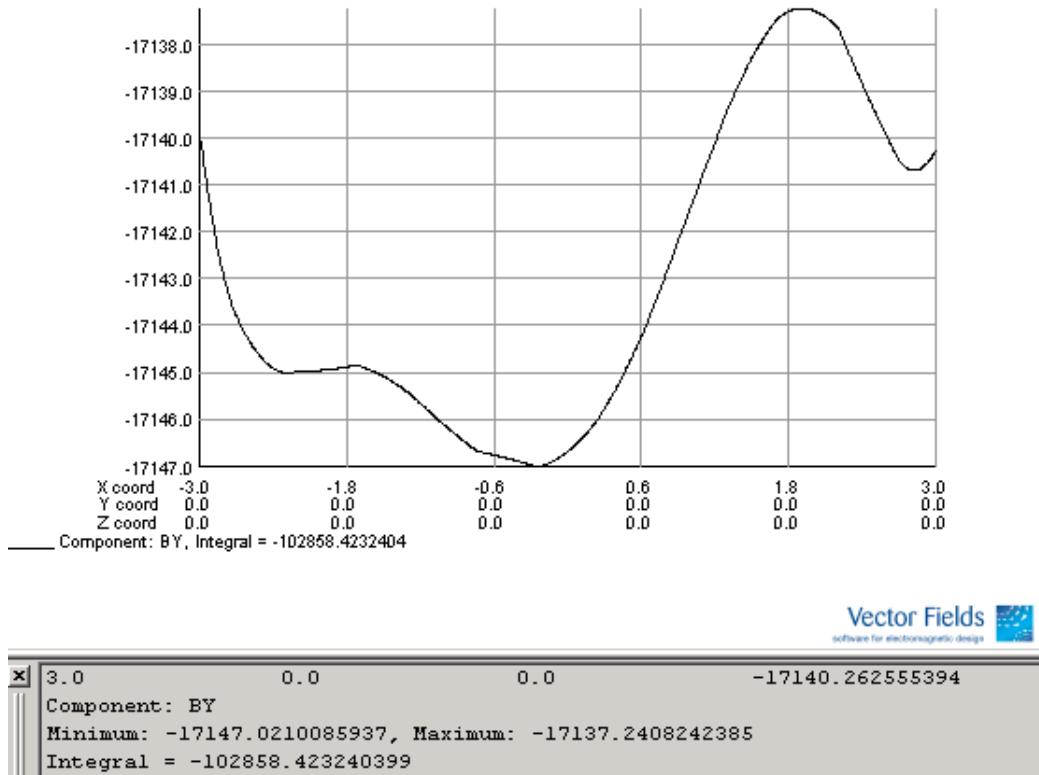

Figure 8 –Field on the good field region at $y=z=0$.

2.2.3. Computation results at $By(0,0)=0,73 T$

Figure 9 shows the field homogeneity as it results from 3D simulations.

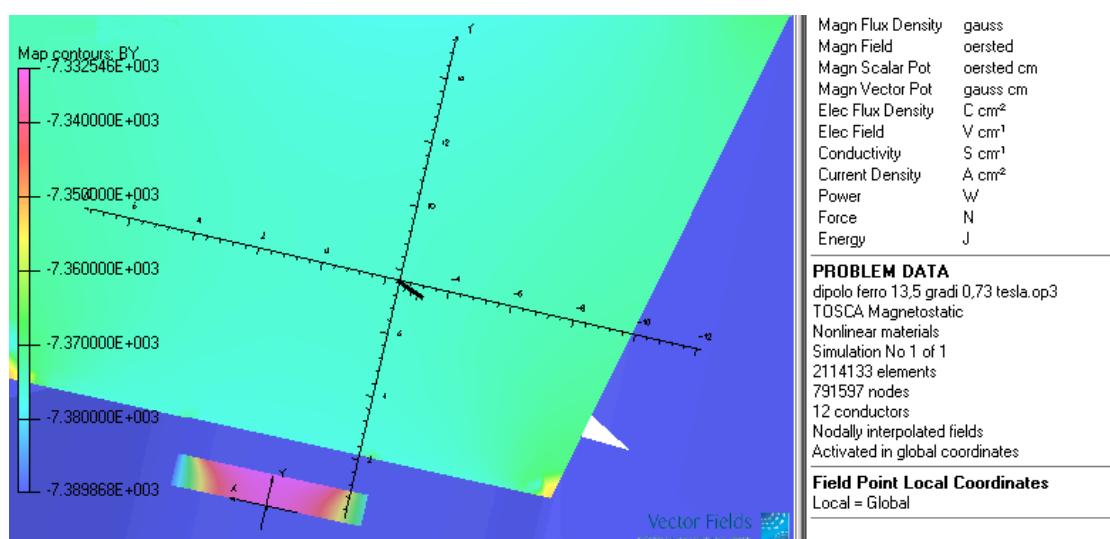

Figure 9 – Field homogeneity in the central part of the dipole. The blue part of the plot corresponds to the coil in a prospective view, while the green part is the iron yoke.

The field quality inside the good field region is:

$$\left| \frac{\Delta B_y}{B_y} \right| \leq 7,07 \cdot 10^{-3}$$

Therefore it does not satisfy the requirement as indicated by 2D simulations. Further analysis will be needed to achieve the required homogeneity at this field value.

Figure 10 shows a plot of the field B_y on the good field region at the of the magnet as function of the x coordinate.

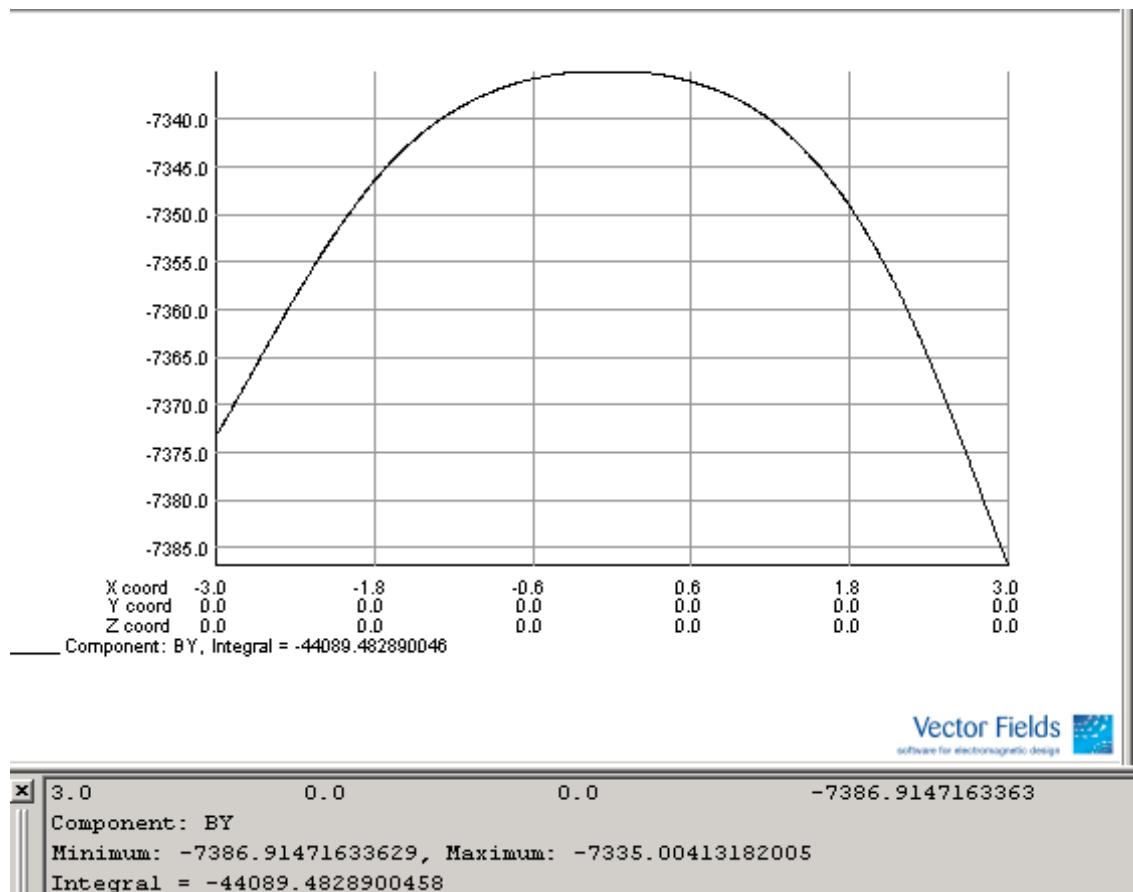

Figure 10 – Field on the good field region at $y=z=0$.

2.3. Fringe Field

Figure 11 shows the fringe field at maximum field calculated on a straight line as close as possible to the reference particle trajectory, starting at the iron edge and extending up to 27,76 cm where the field B_y is zero. B_x and B_z components are null, while B_y values are reported in Table 3.

Table 3 – Values of the dipole fringe field outside the magnet for $B(0,0)=1,718$ T

2.4. Inductance and Magnetic Length

The stored magnetic energy in one fourth of the model at maximum field is

$$U_{mag} = 4751,7 \text{ J}$$

at the operating current of 602,9 A. The dipole inductance will therefore be

$$L_{eq} = \frac{2 \cdot (4 \cdot U_{mag})}{I^2} = 104,6 \text{ mH}$$

In the same way for the minimum field we obtain an inductance value of

$$L_{eq} = \frac{2 \cdot (4 \cdot U_{mag})}{I^2} = 132,4 \text{ mH}$$

with an energy of one fourth of the complete geometry of 648,8 J and a current of 198 A.

2.4.1. Magnetic length

The magnetic length is defined as

$$\text{Magnetic length} = \frac{\int_{-\infty}^{\infty} B_y dl}{B_{y0}}$$

where B_{y0} is the field on the magnet centre and the integration limits are to be extended to a region where the field along the beam direction can be considered null. Magnetic length has been calculated using as integration limits the values of the abscissa ‘l’ for which field goes to zero for the first time without taking into account subsequent field bumps that may occur. The resulting magnetic length at maximum field ($B_{y0}=17146,69 \text{ G}$) is:

$$L_{mag} = 1,13847 \text{ m} .$$

At minimum field ($B_{y0} = 7335,02 \text{ G}$) the magnetic length is

$$L_{mag} = 1,17728 \text{ m} .$$

3. Mechanical and Electrical Parameters

The iron volume evaluated from the simulation is $0,47656 \text{ m}^3$. Being the Stabocor 1200-100A steel density 7850 Kg/m^3 , the dipole weight (without coils) is about 3,74 ton.

The iron length will be 1,223 m, the overall length of the real model will be 1,614 m. The yoke height and width are respectively 0,683 and 0,88 m. These dimensions do not take into account positioning, alignment, clamping tools and resin around copper (see Fig. 13).

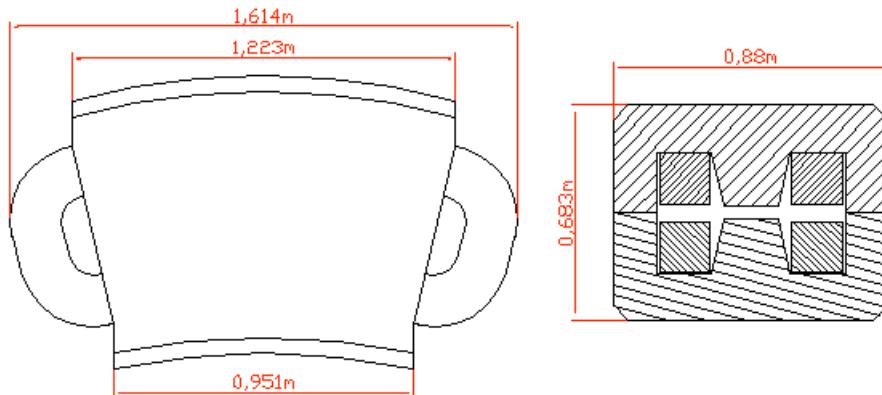

Figure 13 – Iron overall dimensions.

The excitation coil system consists of two coils composed of two 28 degree arcs, four 90 degrees curves and two straight parts. The total length of the conductor in a single coil is $L_{coil} = 290 \text{ m}$, the total conductor length is hence $L_{tot} = 580 \text{ m}$.

The conductor copper area is $234,83 \text{ mm}^2$, the copper resistivity at $51 \text{ }^\circ\text{C}$ is $0,020 \Omega \text{mm}^2/\text{m}$, and hence the total dipole resistance (without taking into account connection cables to the power supply) is

$$R_{dip} = 49,4 \text{ m}\Omega$$

The copper density is 8960 Kg/m^3 and the copper volume is $0,136250 \text{ m}^3$ hence the coils weight is 1,22 ton (this value increases of 10% if we take into account insulation and resin).

The dipole total weight is then

$$M_{dip} = 5,1 \text{ ton}$$

Knowing the magnet resistance ($49,45 \text{ m}\Omega$) the nominal voltage and power in DC (without forcing voltage) can be computed as

$$V_{nom} = V_{dc_nom} = RI_{nom} = 29,8 \text{ V}$$

$$W_{dc_nom} = RI_{nom}^2 = 18,0 \text{ KW}$$

with $I_{max} = 602,9 \text{ A}$, the nominal current deliverable by the power supply at the higher energy.

Maximum values of DC voltage and power at maximum power supply current ($I_{\max} = 650\text{A}$) are respectively:

$$V_{\max} = RI_{\max} = 32,1 \text{ V}$$

$$W_{dc_max} = RI_{\max}^2 = 20,9 \text{ kW}$$

The last calculation deals with coil cooling. The two racetrack coils will be cooled by 4 water circuits, hence the length of a single cooling circuit will be 145 m.

Using a pressure drop across the circuit of 3 atm, the water flow per circuit will be $q = 6,79 \cdot 10^{-5} \text{ m}^3/\text{s}$. The pressure value is yet increased of a factor 1,2 because of hydraulic concentrated losses.

Supposing all the power generated by the coil dissipates into the water, the water temperature rise will be:

$$\Delta T_{\max} = \frac{10^{-6} W}{4,186 q} = 18,4^\circ\text{C}$$

where $W = \frac{RI_{\max}^2}{4} = 5225\text{W}$ is the power dissipated in Watt and q the water flow in m^3/s for every hydraulic circuit. The current used in the calculation is 650 A.

4. Calculated Magnet Parameter List

• Nominal Maximum Field	T	1,718
• Magnet Gap	cm	4,24÷4,3
• Magnetic Length (at maximum energy)	m	1,13847
• Good Field Region	mm	±30 (hor.)
• Field Quality (at max field)		±1x10 ⁻³
• Nom. A-turn per Pole (at maximum field)	A	38585,6
• Turns per Pole		64
• Nominal Current	A	602,9
• Maximum Current	A	650
• Current Density	A/mm ²	2,57
• Maximum Current Density	A/mm ²	2,77
• Copper Conductor	mm ²	17,4x17,4
• Cooling Hole Diameter	mm	9,3
• Resistance per Magnet	mΩ	49,45
• Inductance per Magnet	mH	104,6÷132,4
• Nominal DC Voltage per Magnet	V	29,8
• Maximum DC Voltage per Magnet @ 650A	V	32,1
• Nominal DC Power per Magnet	kW	18,0
• Maximum DC Power per Magnet @ 650 A	kW	20,9
• Water Circuit per Magnet		4
• Water Flow per Magnet	m ³ /s	4 x 6,79 10 ⁻⁵
• Pressure Drop	MPa	0,3
• Water Temperature Rise	°C	18,4
