

$K \rightarrow 3\pi$ Decays in Chiral
Perturbation Theory

Introduction to χ PT

Aim: To study the physics of hadrons (K, π, η) at low energies (few hundred MeV).

Fundamental Theory: QCD

Problem: Low-energy QCD is non-perturbative, ie. we can't use it to get results.

Solution: Build an Effective Theory.

Effective Lagrangian with the **properties:**

- Spontaneously broken Chiral symmetry.
- Relevant fields: K, π, η .

$K \rightarrow 3\pi$ in the isospin limit

Relevant processes:

$$K^\pm \rightarrow \pi^\pm \pi^0 \pi^0$$

$$K^\pm \rightarrow \pi^\pm \pi^\pm \pi^\mp$$

$$K_L \rightarrow \pi^+ \pi^- \pi^0$$

$$K_L \rightarrow \pi^0 \pi^0 \pi^0$$

$$K_S \rightarrow \pi^+ \pi^- \pi^0$$

Isospin limit:

Treating the **up-** and **down-quark** as being identical.

$K \rightarrow 3\pi$ in the isospin limit

1. Does χ PT agree with data?
2. For which values of the free parameters?
3. Conclusions?

Lowest order (p^2) diagrams:

$K \rightarrow 3\pi$ in the isospin limit

One-loop order (p^4), 13 new topologies.

■ p^2 weak vertex

⊠ p^4 weak vertex

$K \rightarrow 3\pi$ in the isospin limit

More complicated:

■ p^2 weak vertex

● p^2 strong vertex

Conclusions

- $K \rightarrow 3\pi$ tree-level **agrees** with various published expressions.

Numerical results:

- Fitted χPT parameters **reproduce** decaywidths and linear slopes.
- Quadratic slopes **more difficult**. Higher order corrections or isospin breaking effects?

Next step:

- Include isospin violations in the amplitudes.

$K \rightarrow 3\pi$ with isospin breaking

Strong isospin breaking:

$m_u \neq m_d \Rightarrow$ Mixing between η and π^0 .

Electromagnetic isospin breaking:

EM charges of the quarks \Rightarrow 40 new topologies.
