

# Very Long Baseline Oscillations

## The BNL VLBL Concept

Brett Viren

Physics Department

7th International Workshop on Neutrino Factories and Superbeams

# Outline

- 1 The Concept
- 2 Oscillation Probability Illustrations
- 3 Example: BNL to Homestake
- 4 Making Very Long Baseline Neutrinos at BNL

## 1 The Concept

- Goals and Overview
- Motivations for Basic Parameters
- Natural Benefits to Going High Energy

## 2 Oscillation Probability Illustrations

## 3 Example: BNL to Homestake

## 4 Making Very Long Baseline Neutrinos at BNL

# Basics of the VLBL Concept

The VLBL concept consists of three simple ideas:

- 1 Use a very **long** baseline,
- 2 a **wide** band  $\nu$ -beam,
- 3 at **high**  $\nu$ -energies.

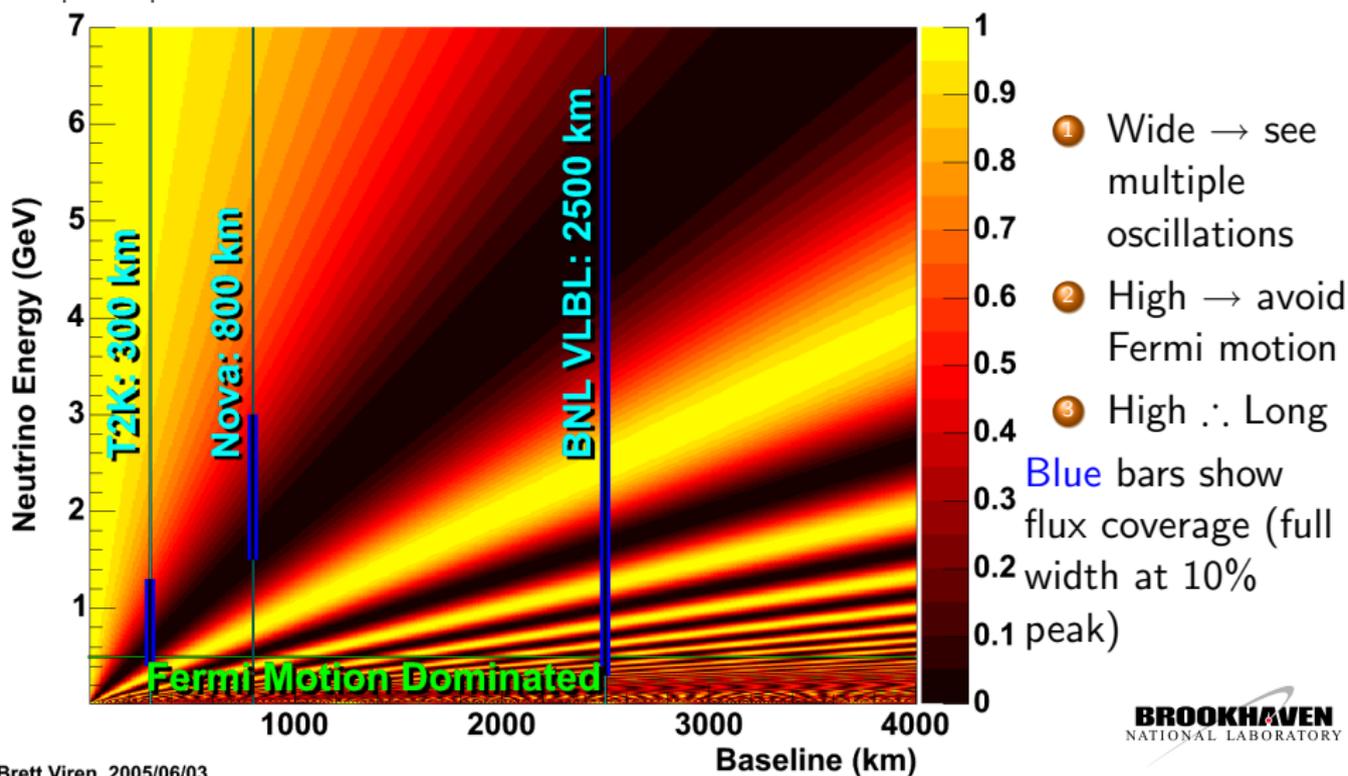

This allows an ambitious but affordable experiment which is qualitatively different than previous or planned LBL experiments.

- It is sensitive to multiple physical effects.
- Allows one to break parameter degeneracies.
- Rough measurement of  $\delta_{CP}$  and  $\theta_{13}$  with only  $\nu$ -running.

If we get lucky with the true parameter values, these statements can be made more strongly.

# Why Long, Wide and High?

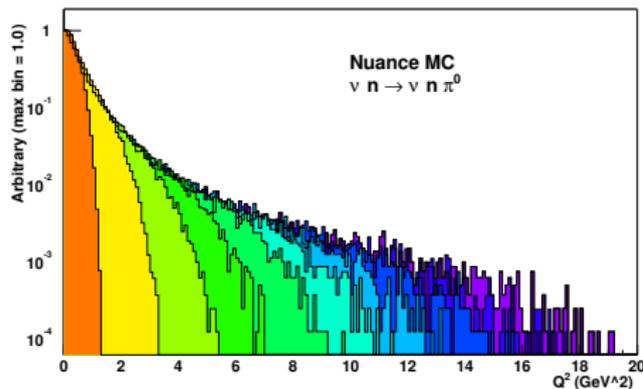

$P(\nu_\mu \rightarrow \nu_\mu)$  (SK/KamLAND best fit point)

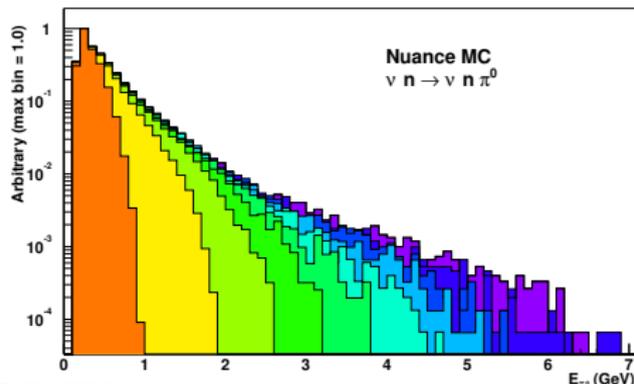

Brett Viren, 2005/06/03

# Natural Background Reduction

$Q^2$  for  $E_\nu = 1-10$  GeV

$E_{\pi^0}$  for  $E_\nu = 1-10$  GeV

Putting some  $\nu_\mu \rightarrow \nu_e$  signal at high energy, gain strong suppression of NC bkg via  $Q^2$  kinematic cutoff

- Nuance MC
- $Q^2$  (top) and  $E_{\pi^0}$  (bottom) for single- $\pi$  NC events
- Each color band: mono-energetic neutrinos, 1-10 GeV in 1 GeV steps.
- At  $E_\nu > 2$  GeV get  $> 50\times$  natural background reduction

- 1 The Concept
- 2 Oscillation Probability Illustrations
  - Disappearance
  - Appearance
- 3 Example: BNL to Homestake
- 4 Making Very Long Baseline Neutrinos at BNL

# Oscillation Probability Illustrations

Unless noted, the values used are:

$$\Delta m_{21}^2 = 8.0\text{e-}5 \text{ eV}^2. \text{ KamLAND/SK/SNO.}$$

$$\Delta m_{32}^2 = 2.5\text{e-}3 \text{ eV}^2. \text{ Super-Kamiokande.}$$

$$\sin^2(2\theta_{23}) = 1.0. \text{ SK atmospheric maximal mixing.}$$

$$\sin^2(2\theta_{12}) = 0.86. \text{ SK/SNO solar mixing.}$$

$$\sin^2(2\theta_{13}) = 0.04. \text{ CHOOZ limited: use "not too big, not too small".}$$

$$\delta_{CP} = 0. \text{ Totally unknown.}$$

**Baseline** = 2540 km (other, short baselines shown for comparison)

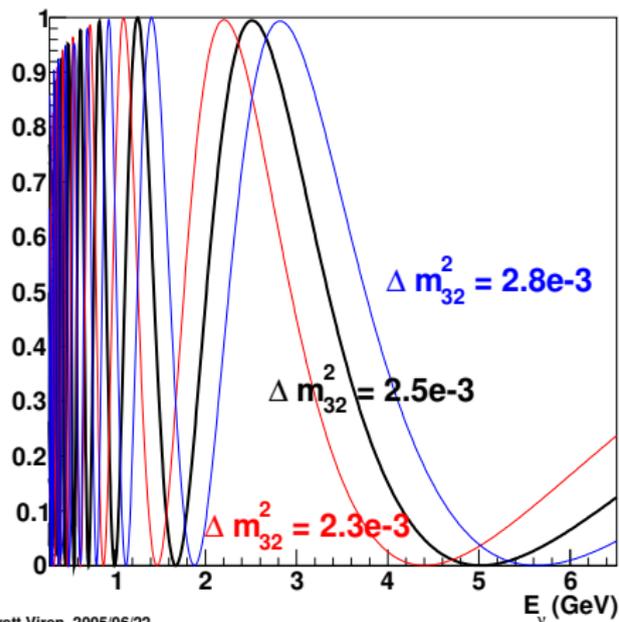

**Matter effects** using PREM Earth density and electron fraction profile.

Probability plots:

- Energy range will reflect full-width-10%-max coverage.
- Flash short baseline examples to compare.

# Multiple Disappearance Oscillations Well Covered!

$P(\mu\mu)$  at 2540 km

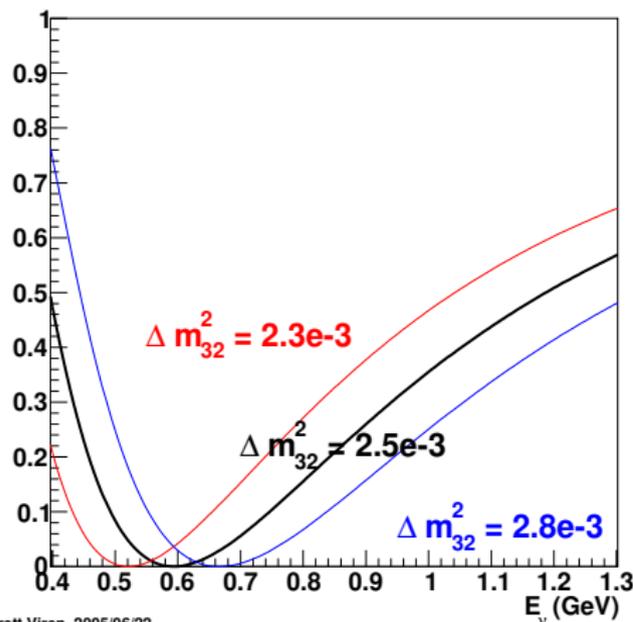

Brett Viren, 2005/06/22

- Multiple wiggles!
- No problem resolving “the dip”, will see more than one!
- Nodes well placed across flux coverage, robust against  $\Delta m^2$  change.

# Disappearance at Short Baselines

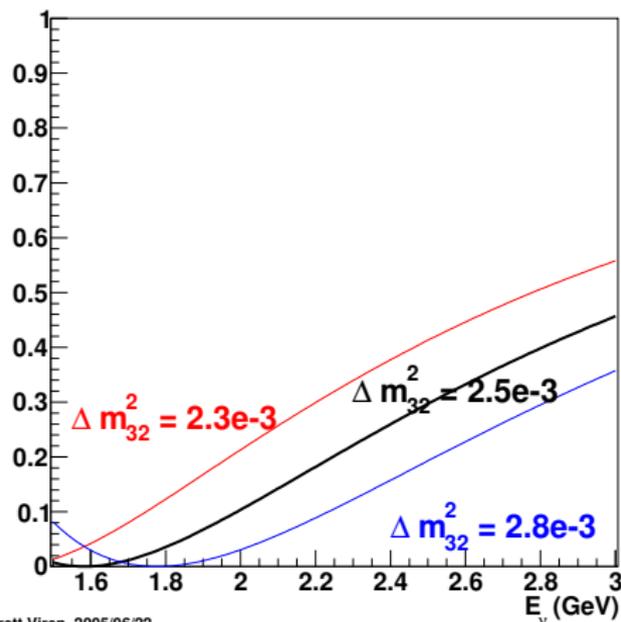

At most one dip to see. Can slip away if  $\Delta m^2$  ends up low.

$P(\mu\mu)$  at 300 km

Brett Viren, 2005/06/22

$P(\mu\mu)$  at 800 km

Brett Viren, 2005/06/22

Brookhaven  
NATIONAL LABORATORY

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

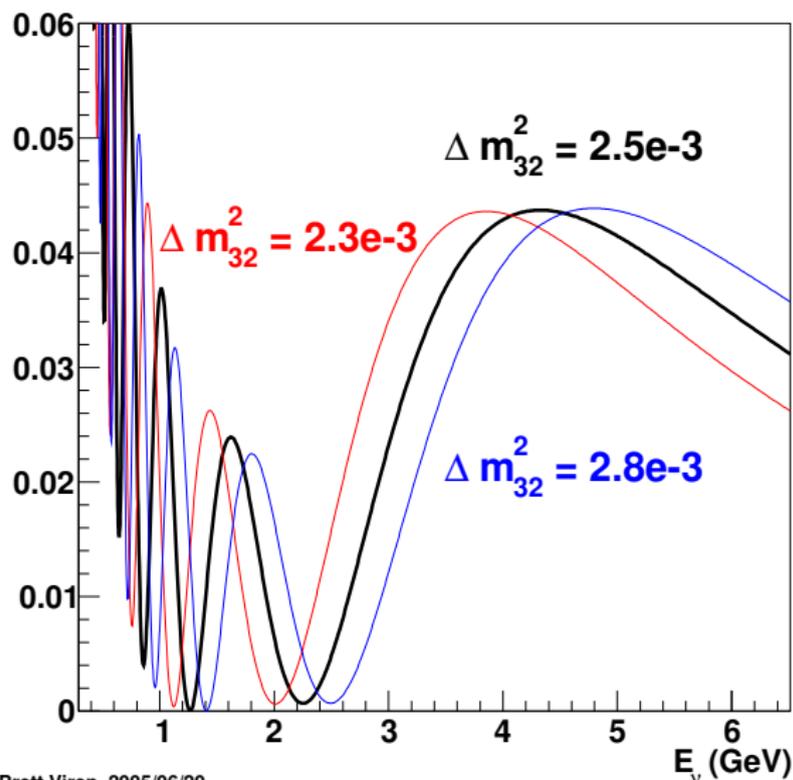

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

- Multiple Appearance Peaks

# Multiple Appearance Peaks Covered

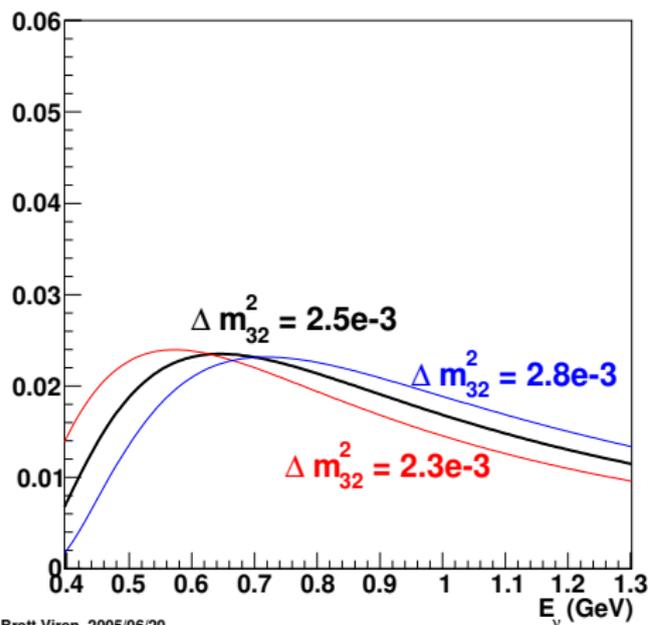

$P(\mu, e)$  at 2540 km

- Multiple peaks covered
- Robust against  $\Delta m^2$  change

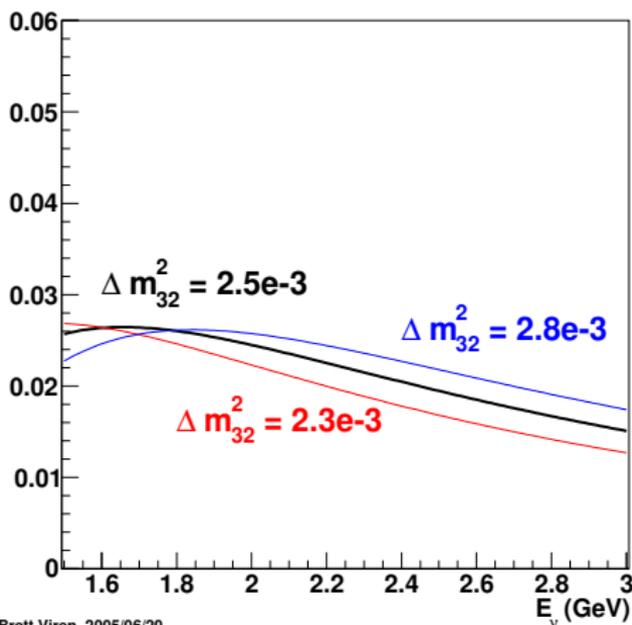

# Appearance at Short Baselines

$P(\mu, e)$  at 300 km

Brett Viren, 2005/06/20

$P(\mu, e)$  at 800 km

Brett Viren, 2005/06/20

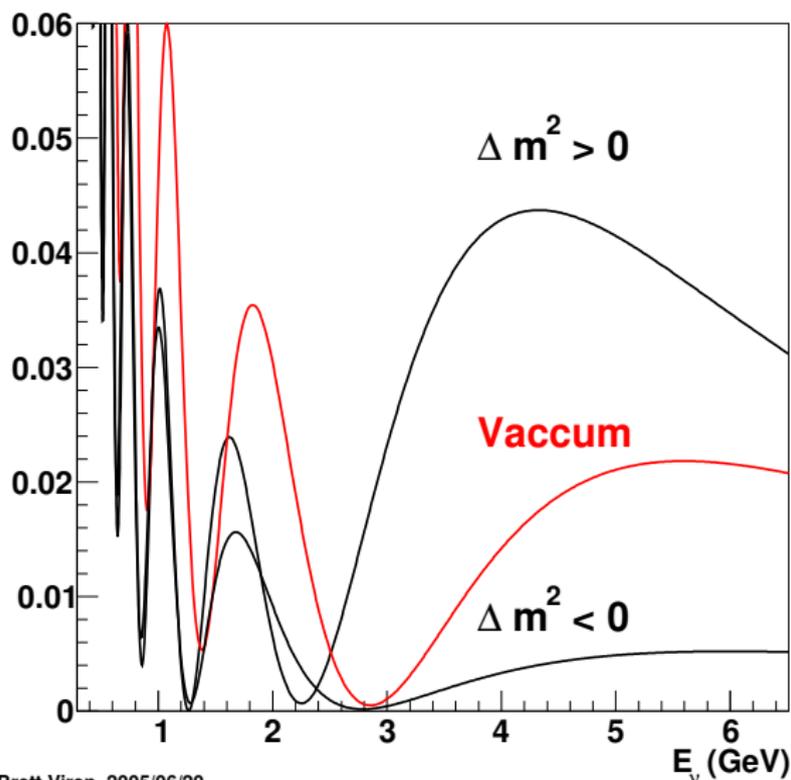

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

- Multiple Appearance Peaks
- Matter Effects

# Matter Effects at Very Long Baselines

$P(\mu, e)$  at 2540 km

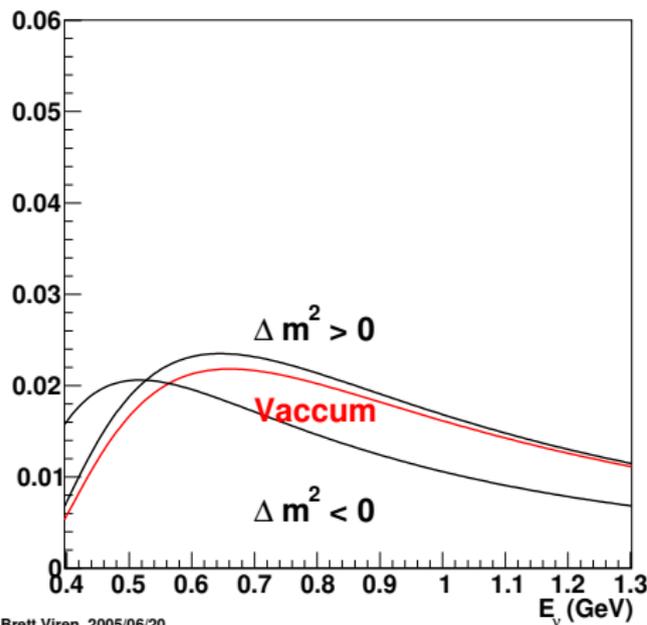

Brett Viren, 2005/06/20

Sensitivity to  $sign(\Delta m^2)$

- Factor of 2 effect  $\rightarrow$  “easy”
- Effect mostly in first peak  $E_\nu > 2$  GeV

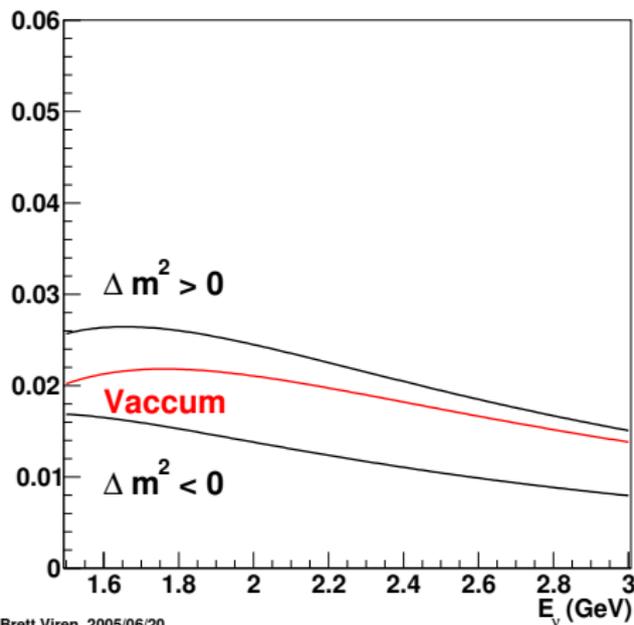

# Matter Effects at Short Baselines

$P(\mu, e)$  at 300 km

Brett Viren, 2005/06/20

$P(\mu, e)$  at 800 km

Brett Viren, 2005/06/20

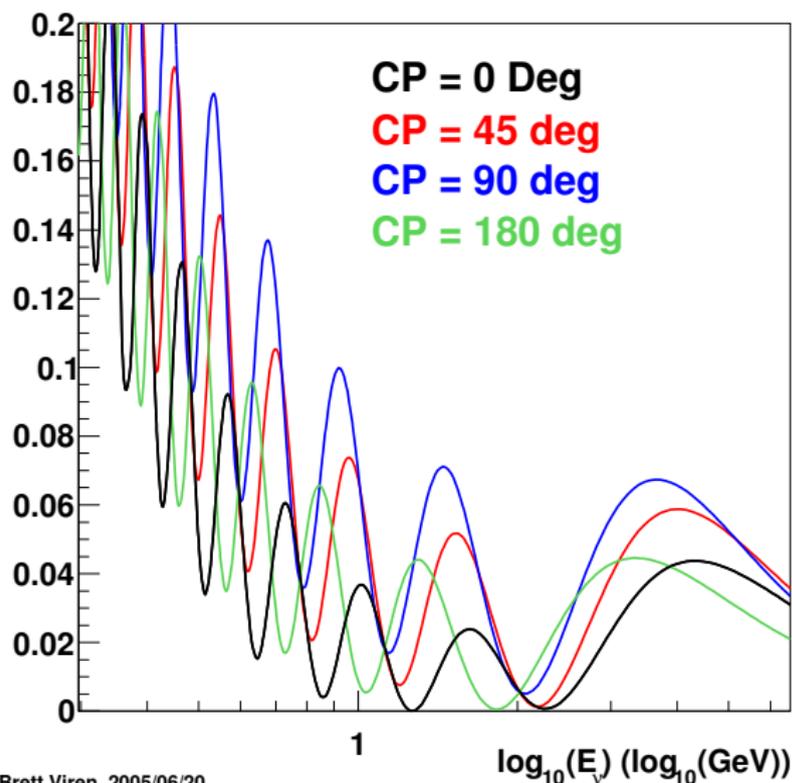

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

- Multiple Appearance Peaks
- Matter Effects
- CP Violation

# Nonzero CP Angle at Very Long Baselines

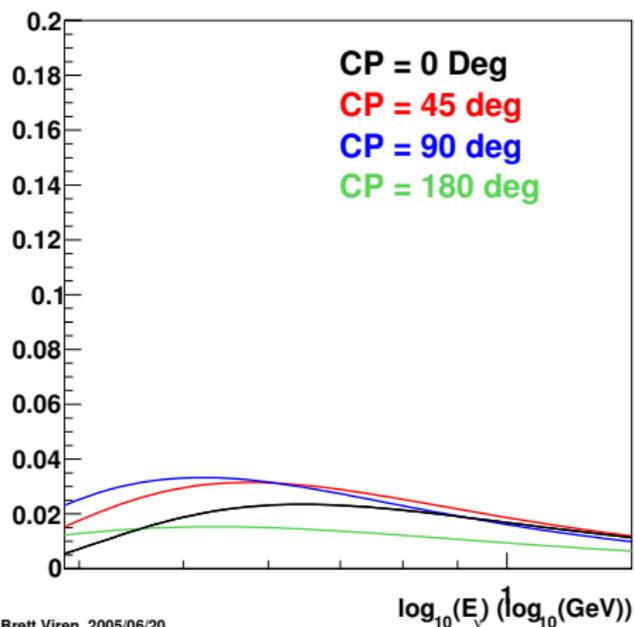

$P(\mu, e)$  at 2540 km

- Shift in magnitude and location
- Stronger effect for oscillation peak  $n > 1$  (W. Marciano)
- Longer baseline pulls  $n > 1$  away from Fermi-motion region.

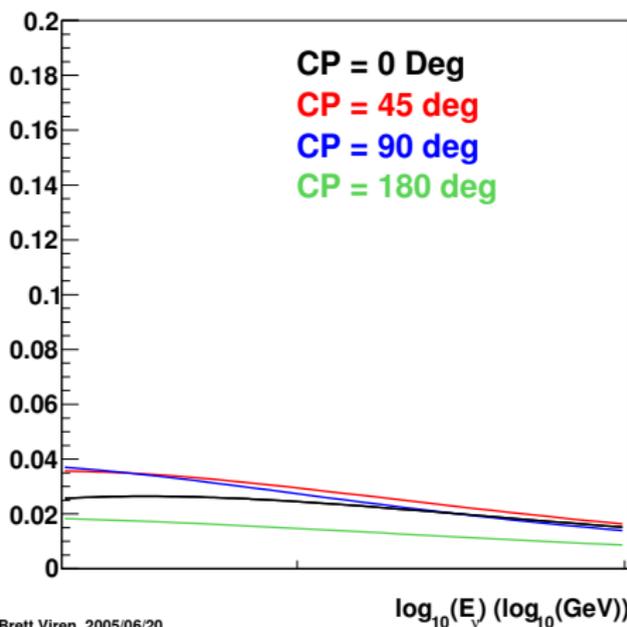

# Nonzero CP Angle at Short Baselines

$P(\mu, e)$  at 300 km

Brett Viren, 2005/06/20

$P(\mu, e)$  at 800 km

Brett Viren, 2005/06/20

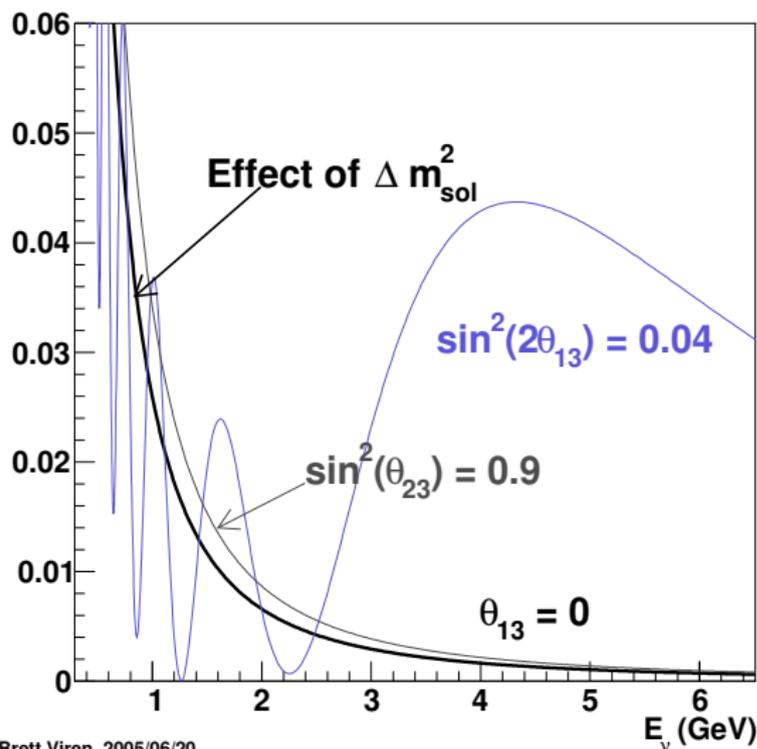

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

- Multiple Appearance Peaks
- Matter Effects
- CP Violation
- $\nu_e$  Appearance with  $\theta_{13} = 0!$

# Guaranteed $\nu_e$ Appearance

$P(\mu, e)$  at 2540 km

Brett Viren, 2005/06/20

What if  $\theta_{13} = 0$  ?

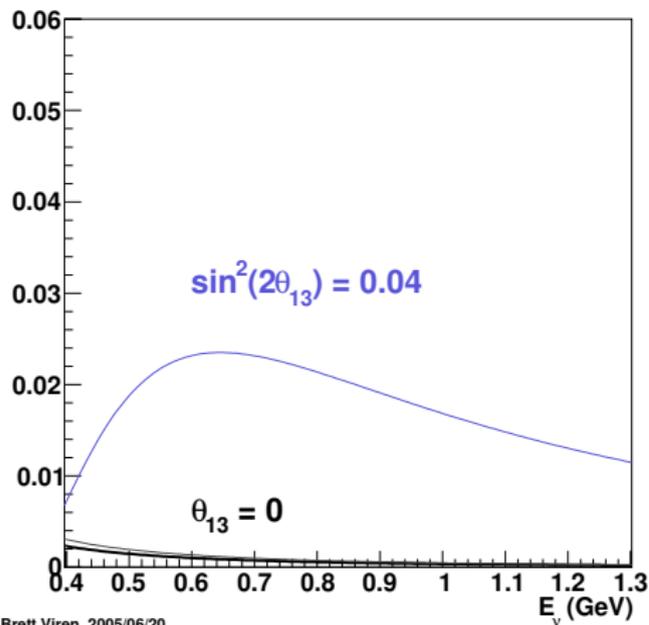

Still observe  $\nu_e$  via  $\Delta m_{21}^2$  !

- $\theta_{13} = 0$  in black
- $\theta_{13} \neq 0$  in blue
- Upswing at low energies is due to  $\Delta m_{21}^2$ .
- Small shift if non-maximal mixing

This over constrains the solar parameters - potential to see new physics!

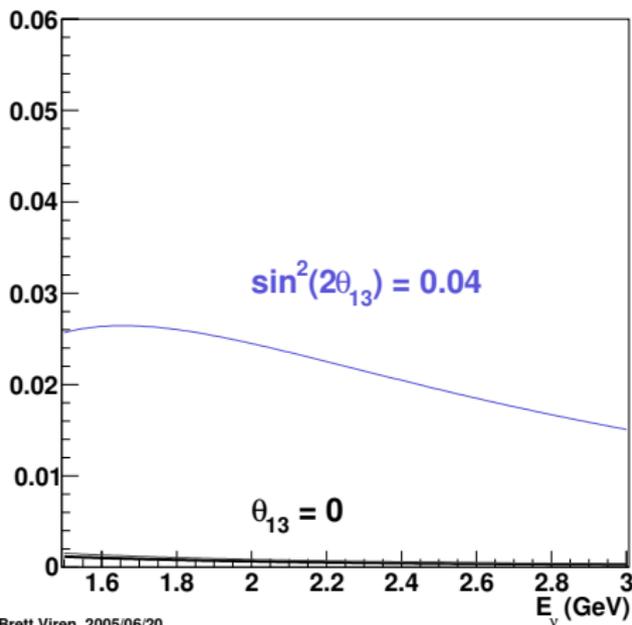

# $\theta_{13} = 0$ at Short Baselines

$P(\mu, e)$  at 300 km

Brett Viren, 2005/06/20

$P(\mu, e)$  at 800 km

Brett Viren, 2005/06/20

# Rich Appearance Effects

The Very Long Baseline approach makes available a rich set of appearance effects.

- Multiple Appearance Peaks
- Matter Effects
- CP Violation
- $\nu_e$  Appearance with  $\theta_{13} = 0!$

Since these effects occur differently across the spectrum in a Very Long Baseline experiment, they can be disentangled with a single experiment.

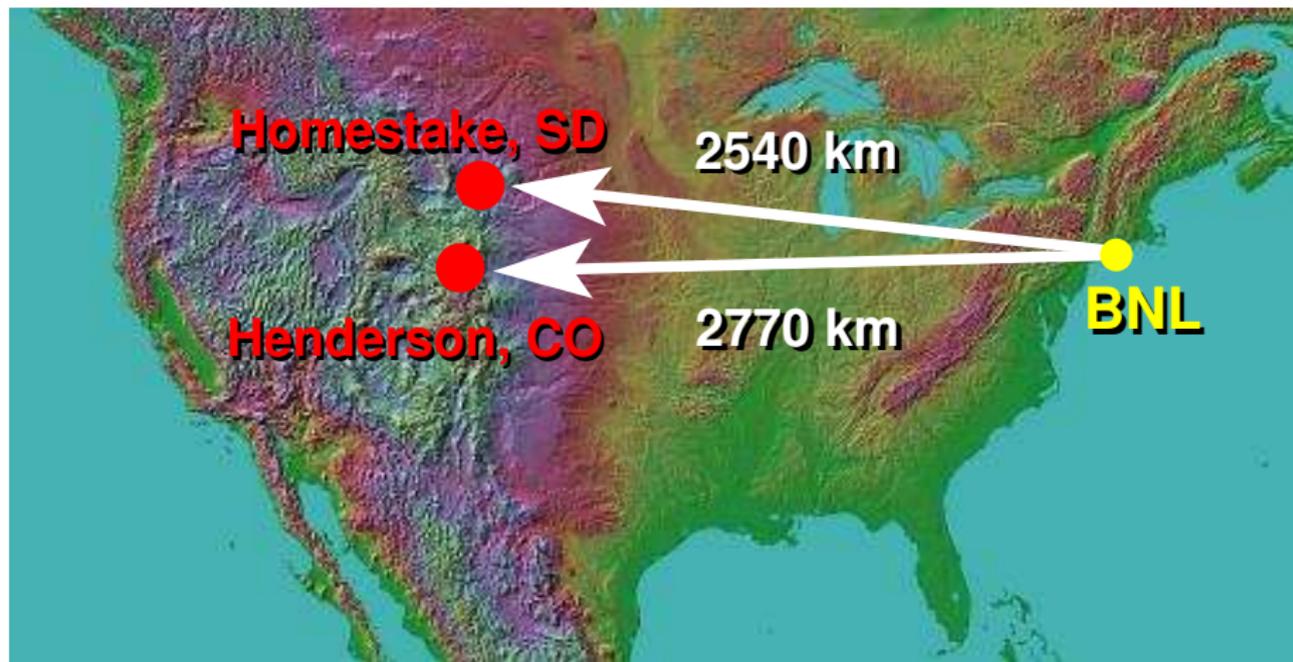

# Sensitivity to Different Parameters in Different Energy Regions

	$E_\nu < 1 \text{ GeV}$	$1 < E_\nu < 2 \text{ GeV}$	$E_\nu > 2 \text{ GeV}$
$\sin^2 2\theta_{13}$	✓	✓	✓
$\text{sign}(\Delta m_{32}^2)$	-	-	✓✓✓
$\delta_{CP}$	✓	✓✓	✓
solar	✓✓✓	✓	-

- It's a complex picture with many effects!
- But, effects have different strength at different energies.
- Measuring across the wide energy band makes it possible to sort them out.

- 1 The Concept
- 2 Oscillation Probability Illustrations
- 3 Example: BNL to Homestake
  - Event Rate
  - Disappearance
  - Appearance
- 4 Making Very Long Baseline Neutrinos at BNL

## Example Baseline: 2540 km

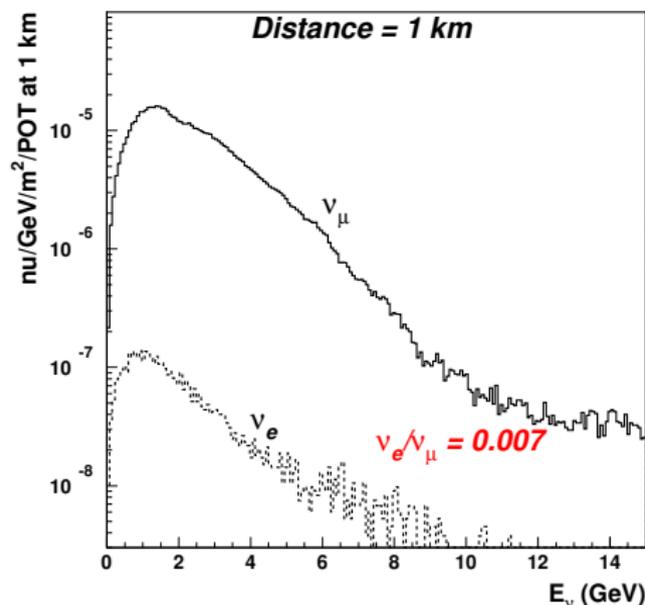

Homestake & Henderson equivalent. Assume UNO class far detector.

# Neutrino Flux

The following is work by Milind Diwan.

## BNL Wide Band. Proton Energy = 28 GeV

$\nu$  running:

- 1 MW, 28 GeV proton beam
- $5 \times 10^7$  seconds
- $1.12 \times 10^{22}$  PoT
- 60 cm carbon target
- 4 m  $\phi \times$  200 m long decay tunnel

$\bar{\nu}$  running same but 2 MW

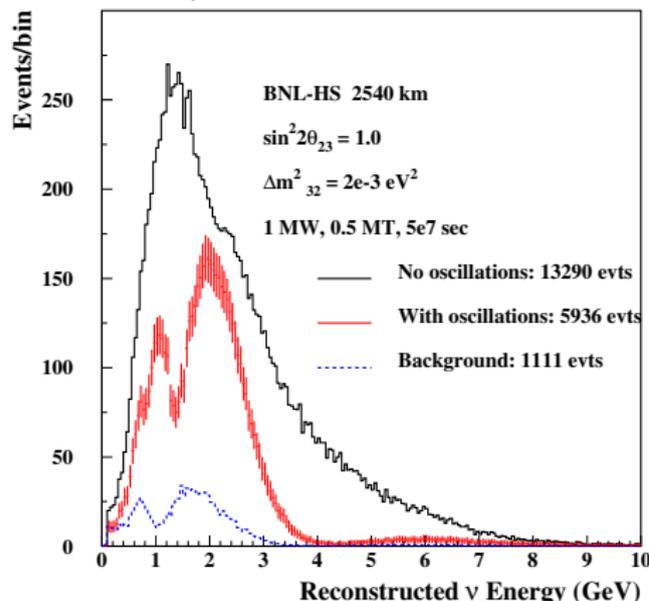

# Expected Number of Events

- 1 MW  $\nu$  running
- Water-Cherenkov detector
- 500 kTon water fiducial
- 2540 km baseline
- $5 \times 10^7$  seconds exposure

Reaction	Number
CC $\nu_\mu + N \rightarrow \mu^- + X$	51800
NC $\nu_\mu + N \rightarrow \nu_\mu + X$	16908
CC $\nu_e + N \rightarrow e^- + X$	380
QE $\nu_\mu + n \rightarrow \mu^- + p$	11767
QE $\nu_e + n \rightarrow e^- + p$	84
CC $\nu_\mu + N \rightarrow \mu^- + \pi^+ + N$	14574
NC $\nu_\mu + N \rightarrow \nu_\mu + N + \pi^0$	3178
NC $\nu_\mu + O^{16} \rightarrow \nu_\mu + O^{16} + \pi^0$	574
CC $\nu_\tau + N \rightarrow \tau^- + X$ (if all $\nu_\mu \rightarrow \nu_\tau$ )	319

# Disappearance at 2540 km

## $\nu_\mu$ DISAPPEARANCE

- 10% energy resolution + Fermi motion
- 2 nodes clearly visible
- **Black** and **red** include background
- Only single- $\pi$  production bkg considered here
- $\sigma(\Delta m^2_{32})$  &  $\sigma(\sin^2(2\theta_{23})) \sim 1\%$
- Resolution dominated by systematics

## Expected Appearance Results

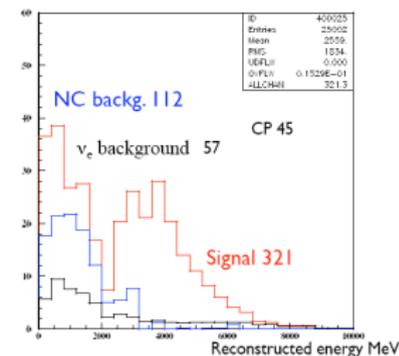

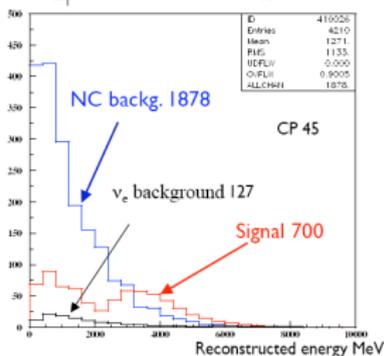

- 1 Weighted SK Atm- $\nu$  MC/reconstruction study (C. Yanagisawa)
- 2 Baseline requirements study (M. Diwan)
- 3 In progress: full study with UNO detector MC and realistic reconstruction code.

# C. Yanagisawa - weighted SK Atm- $\nu$ MC study

## Complete water Cherenkov detector simulations progress

$\nu_e$  CC for signal ; all  $\nu_{\mu,\tau,e}$  NC,  $\nu_e$  beam for background

- $\Delta m^2_{21} = 7.3 \times 10^{-5} \text{ eV}^2$ ,  $\Delta m^2_{31} = 2.5 \times 10^{-3} \text{ eV}^2$
- $\sin^2 2\theta_{12}(12,23,13) = 0.86/1.0/0.04$ ,  $\delta_{CP} = +45, +135, -45, -135^\circ$

Select single ring events and  
select electrons

Signal/backg = 700/2005

Perform analysis of single  
electron pattern, likelihood cut  
retaining ~50% of signal.

Signal/back = 321/169

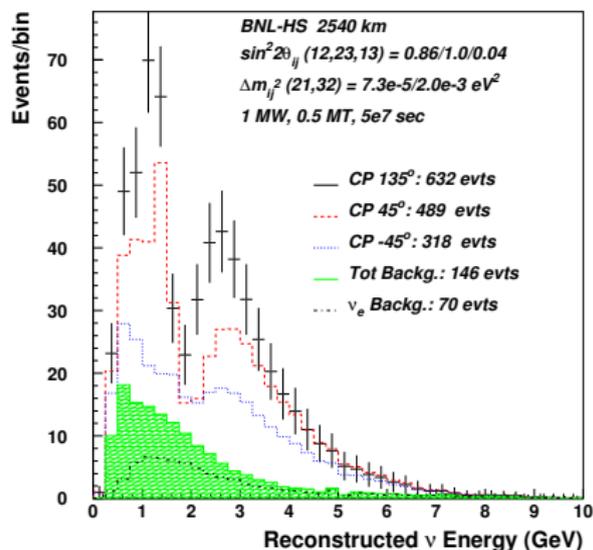

C. Yanagisawa (Stony Brook), 3<sup>rd</sup> BNL/UCLA workshop  
<http://www.physics.ucla.edu/hep/proton/proton2005.htm>

Improved  $\pi^0$  finder + likelihood cut.

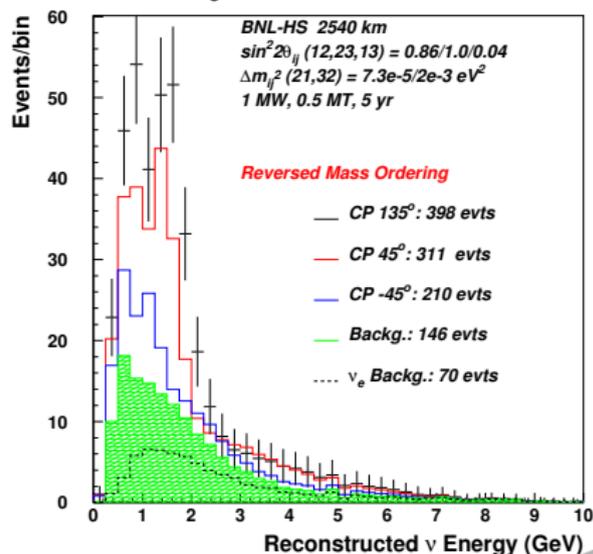

# Appearance - Baseline Requirements Study

M. Diwan, close but stricter requirements still:

## $\nu_e$ APPEARANCE

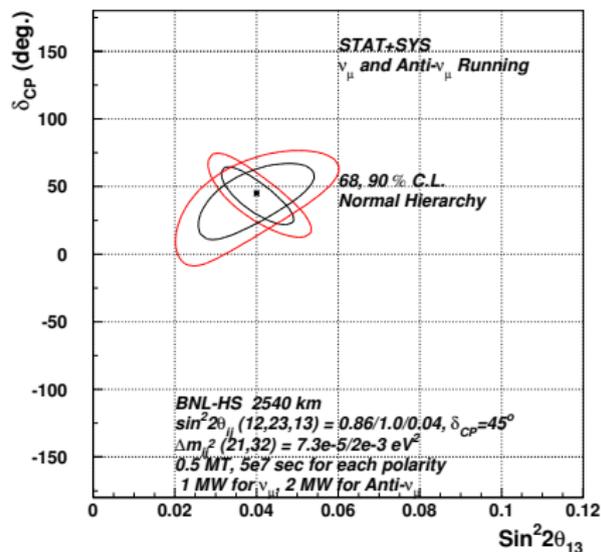

## $\nu_e$ APPEARANCE

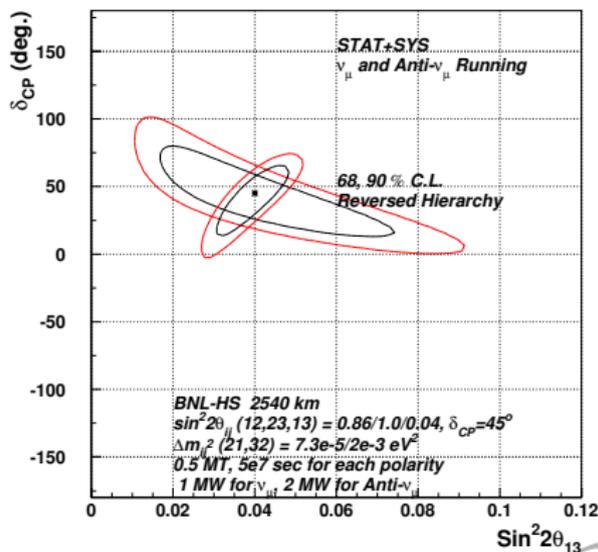

# Sensitivity of $\delta_{CP}$ and $\theta_{13}$

1- $\sigma$  and 90% contours, all other parameters fixed.

### Resolution $\delta_{CP}$ vs $\text{Sin}^2 2\theta_{13}$

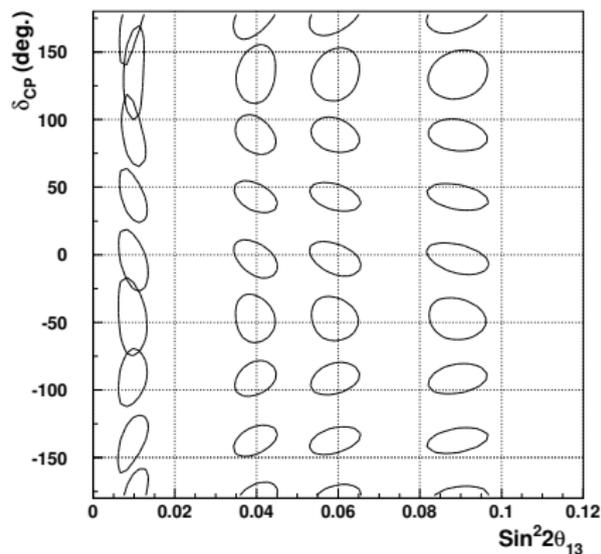

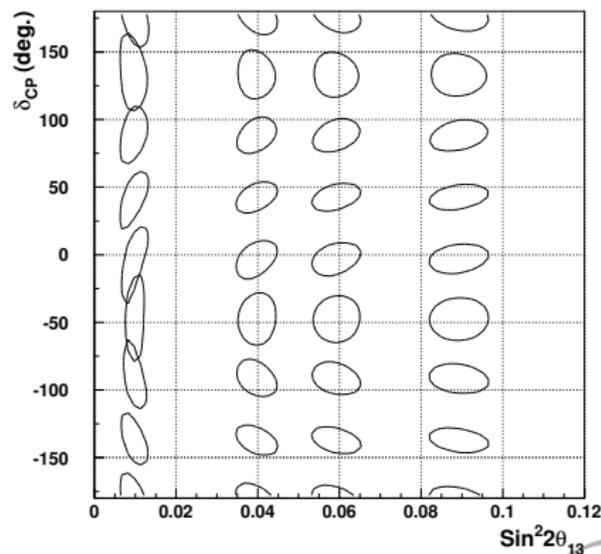

### Resolution $\delta_{CP}$ vs $\text{Sin}^2 2\theta_{13}$

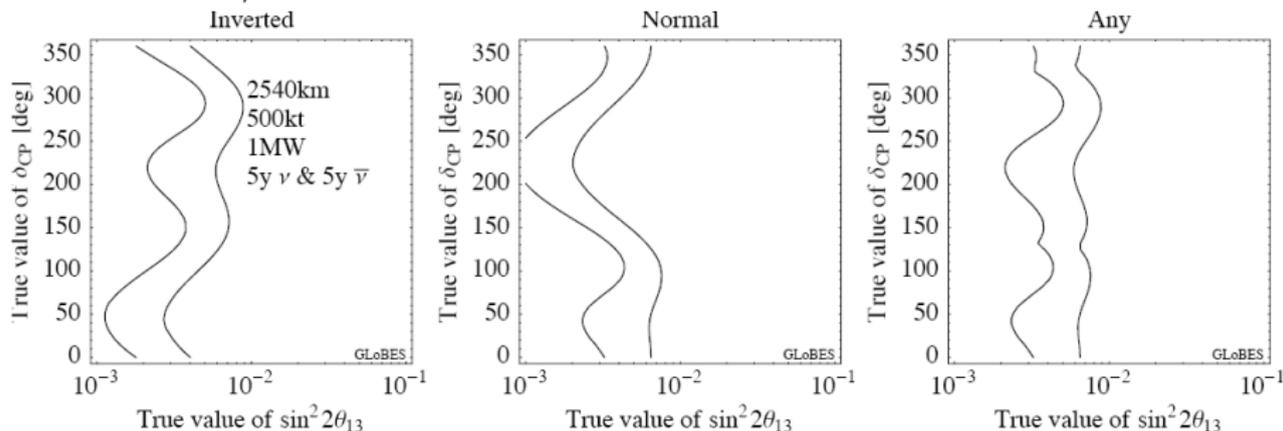

Sensitivity of  $\delta_{CP}$  and  $\theta_{13}$  - Combined  $\nu/\bar{\nu}$ 

1- $\sigma$  contours, all other parameters fixed.

Regular hierarchy  $\nu\bar{\nu}$  and Antin $\nu\bar{\nu}$  runningReversed hierarchy  $\nu\bar{\nu}$  and Antin $\nu\bar{\nu}$  running

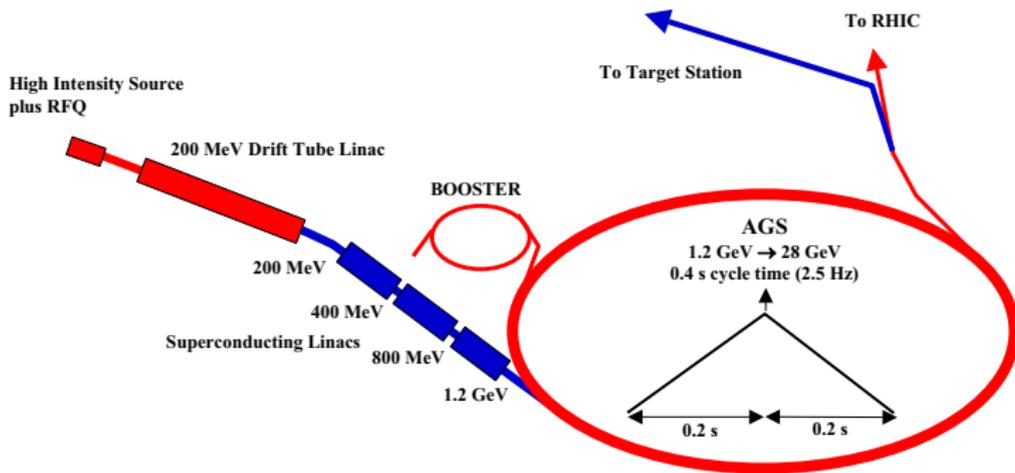

Patrick Huber, UWisc:

- Both  $\nu$ - and  $\bar{\nu}$ -running.
- Includes correlations and errors on all parameters, 10% background uncertainty.
- Will improve as other oscillation parameter measurements improve.
- All  $\delta_{CP}$  range covered.

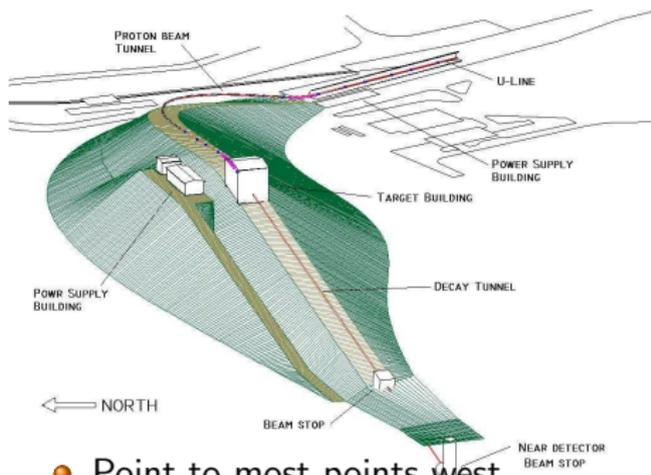

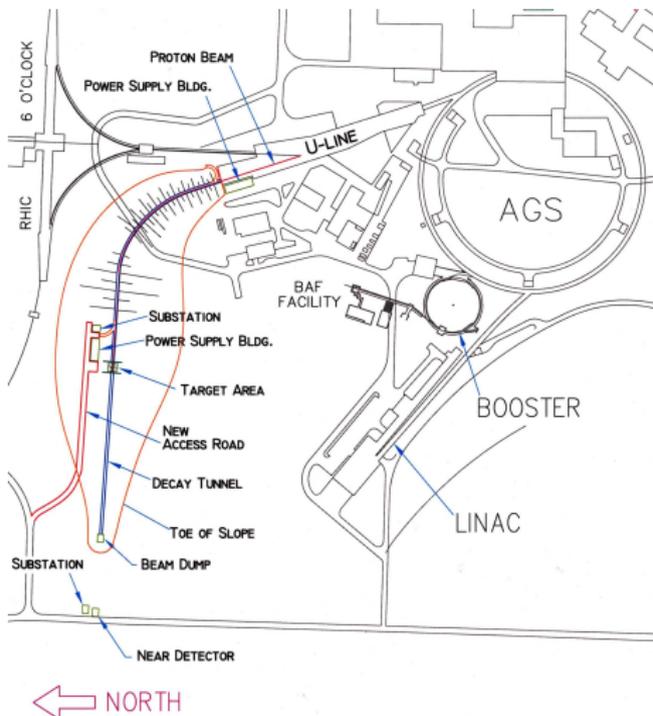

- 1 The Concept
- 2 Oscillation Probability Illustrations
- 3 Example: BNL to Homestake
- 4 Making Very Long Baseline Neutrinos at BNL
  - AGS Upgrade
  - BNL Site Development
  - Target and Horn
  - Price Tag

# Upgrade to AGS

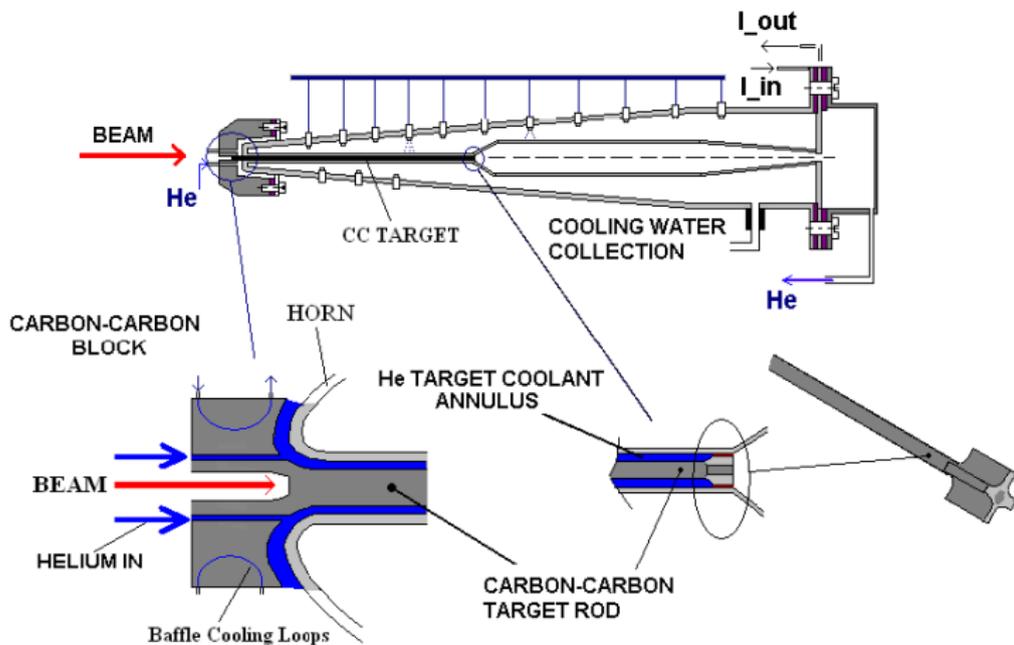

- Use 1.2 GeV SC Linac instead of booster
  - ▶  $7 \times 10^{13} \rightarrow 9 \times 10^{13}$  ppp
  - ▶ Fill time 0.6 sec  $\rightarrow$  1.0 msec
- Increase rep. rate 0.5  $\rightarrow$  2.5 Hz
- New mag. PS and RF cavities
- Further improvements on design being worked on.

# BNL Site Development

- Point to most points west
- Keep hadrons above the water table
- Room for a (very) near detector
- Hill cheaper than tunnel

- Conventional pulsed hadron focussing with 2 horns
- Likely carbon-carbon target, embedded in 1st horn
- R&D underway with material experiments
- Collaboration with FNAL, JPARC and others

# Estimated Costs

October 1, 2004

BNL-73210-2004-IR

## The AGS-Based Super Neutrino Beam Facility Conceptual Design Report

Editor: W. T. Weng, M. Diwan, and D. Rraparia

 Upton, NY 11973  
 October 1, 2004

- Put through internal BNL review
- Bottom-up estimation with WBS
- Based on RHIC & SNS ring, LHC magnets.
- Target & Horn from BNL, K2K and NuMI.
- \$273.4M FY04
- 6 Years to neutrinos
  - ▶ 3 years R&D
  - ▶ Construction after 1 year
  - ▶ 4.5 years to completion
  - ▶ 0.5 year commissioning

## Summary

- The BNL Very Long Baseline concept provides a qualitatively different experiment than past or proposed
- Precision (1%) measurement of atm- $\nu$  params, systematics limited.
- Degeneracy-broken measurement of appearance parameters
- If lucky,  $\nu$ -running only needed for appearance measurements, with  $\bar{\nu}$ -running gain precision w/out needing luck.
- Appearance results limited by how well background can be controlled
- Work on full detector simulation and reconstruction to be finished before final word.
- Affordable, practical beam design. No “magic” needed.
- Ongoing collaborations (C. Yanagisawa (UNO), P. Huber (GLoBES)), others most welcome!

## 1 GeV neutrino, vacuum

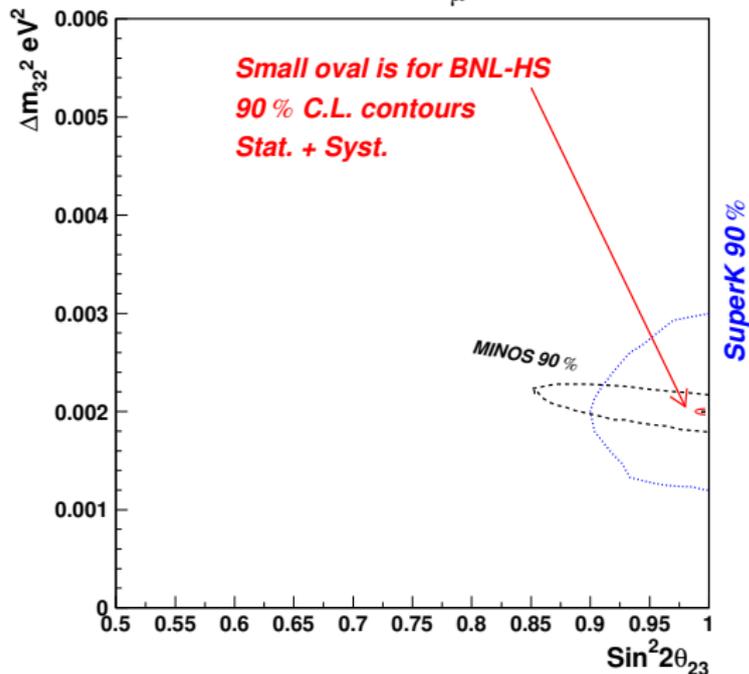

Brett Viren, bv@bnl.gov, 06/04/2004

- Marciano, hep-ph/0108181
- $A \sim L$
- Flux  $\sim 1/L^2$
- Statistical F.O.M.
  - ▶  $= (\Delta A/A)^{-2}$
  - $= A^2 N / (1 - A)$
  - ▶  $N = N_{\nu_e} + N_{\bar{\nu}_e}$
  - ▶ Linear in flux
  - ▶ Quadratic in A

Independent of BL, at least until the flux totally runs out.

# Resolution on $\theta_{23}$ and $\Delta m_{32}^2$

## Test point for $\nu_\mu$ disapp

- Energy scale systematic not included (SK has 2.5%)
- O.w.  $\sigma(\Delta m_{32}^2) \sim 1\%$
- Not strongly sensitive on normalization uncertainty due to multi-nodal spectrum shape.
