1 How to setup the KLOE environment on the LNF AFS cell

The /kloe/soft disk is mirrored every night to the KLOE AFS cell

/afs/kloe.infn.it/export/soft

Small changes in the login and startup procedures allow to run KLOE tools in the LNF AFS cell without environment redefinitions.

The steps required are the following:

- Login in, for instance, axcalc
- klog to the KLOE cell using the command

  klog -principal *username* **-cell kloe.infn.it**

Define the first time the symbol $KLOE in the following way:

setenv KLOE /afs/kloe.infn.it/export/soft

add the line

source $KLOE/onl/working/daq/default/.cshrc

to the own .cshrc in the LNF cell and

source .cshrc

Check that you can run Event display doing the following:

packman didone
start_didone

Event files that are resident on not-exported kloe filesystems where the KID deamon is running, in particular recalled areas, can be used as input to the Event display. As an example, the following URL can be used activating A_C from KID

remote:ybos:/recalled11/filename@fsun11
