

# Status report on

$$\eta \rightarrow \pi^+ \pi^- e^+ e^-$$

Phi-decays WG meeting 28-02-2007

# ***Since the last meeting...***

We were with S/B 1:5 and  
main background  $\phi \rightarrow \rho\pi \rightarrow \pi^+\pi^-e^+e^-\gamma$

MC studies in order to:  
improve signal selection  
identify other sources of background  
and possible rejection

MC sample studied:  
716 pb<sup>-1</sup> for mrc  
8·10<sup>5</sup> events signal private MC

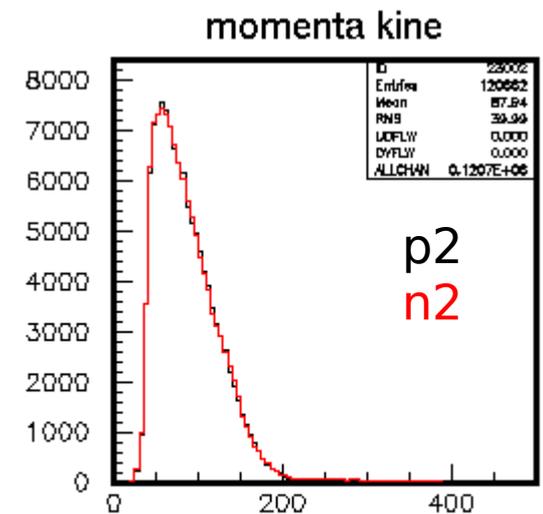

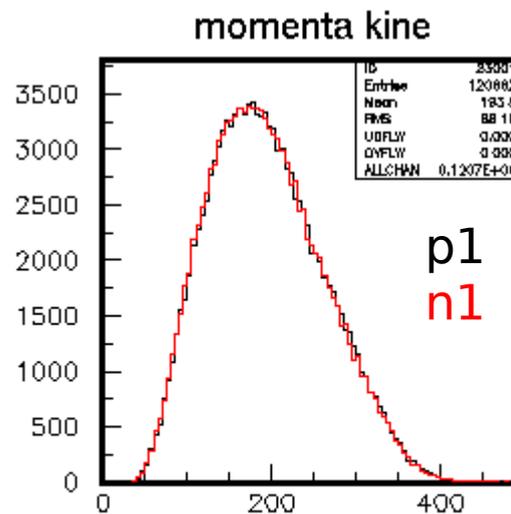

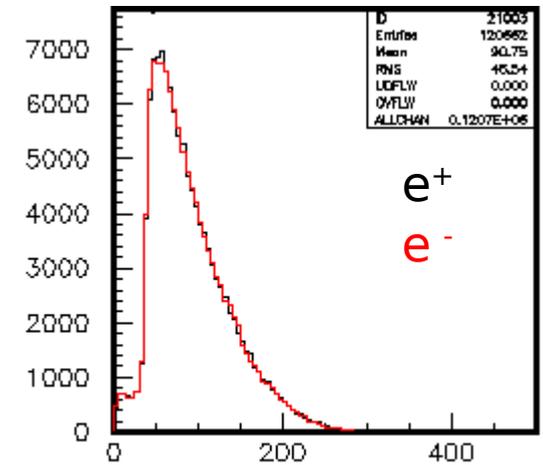

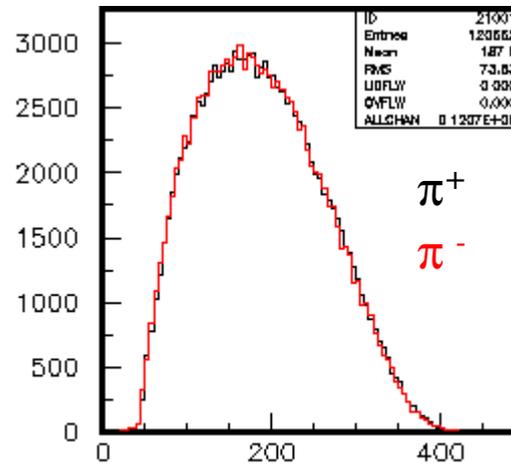

Started looking at data

Bug fixed in retrieving infos from kinematic fit

# Tracks selection

Tracks ordered  
by momentum

Charge requirement:  
2 positive and  
2 negative from IP

Private signal MC

# Tracks selection

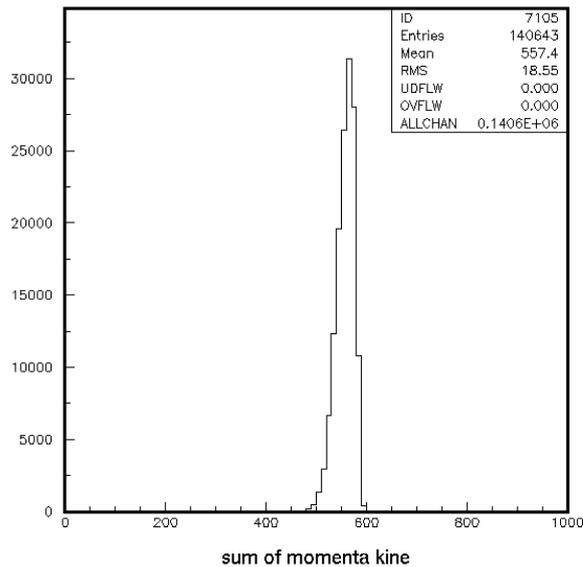

Inserted check on broken tracks:

$$|\Delta P_z| < 3 \text{ MeV}$$

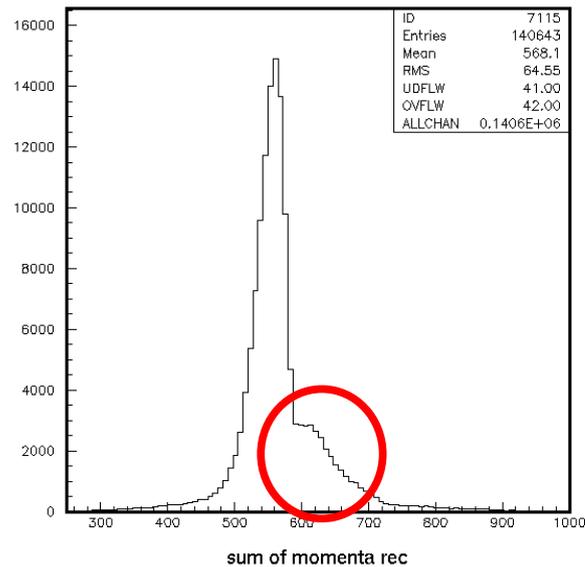

$$|\Delta P_t| < 4.5 \text{ MeV}$$

Private signal MC

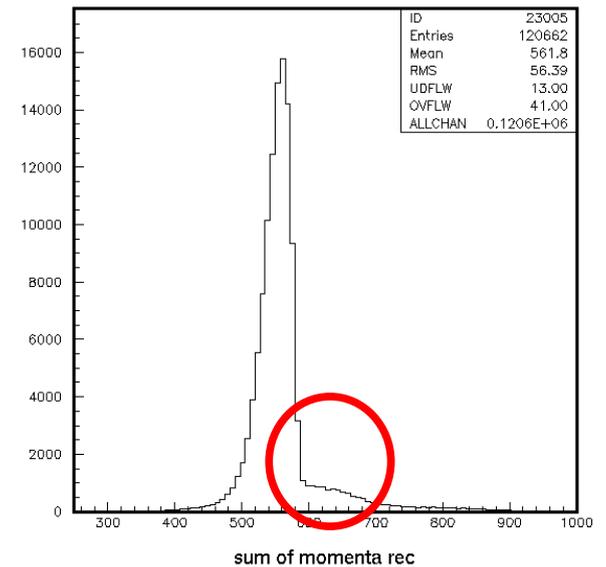

Kine

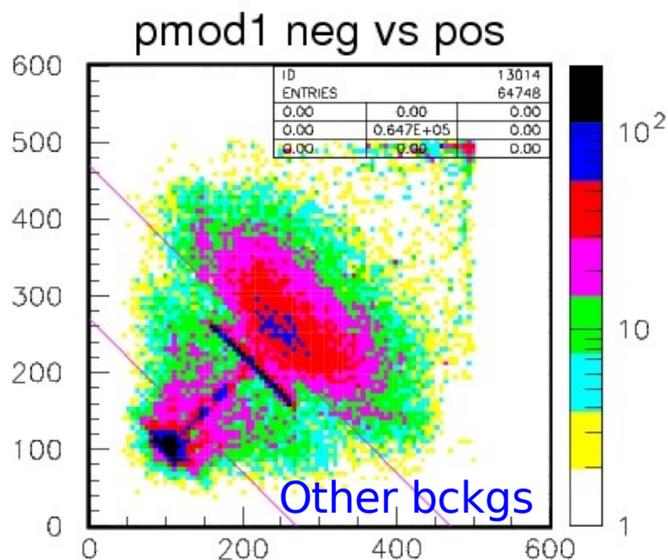

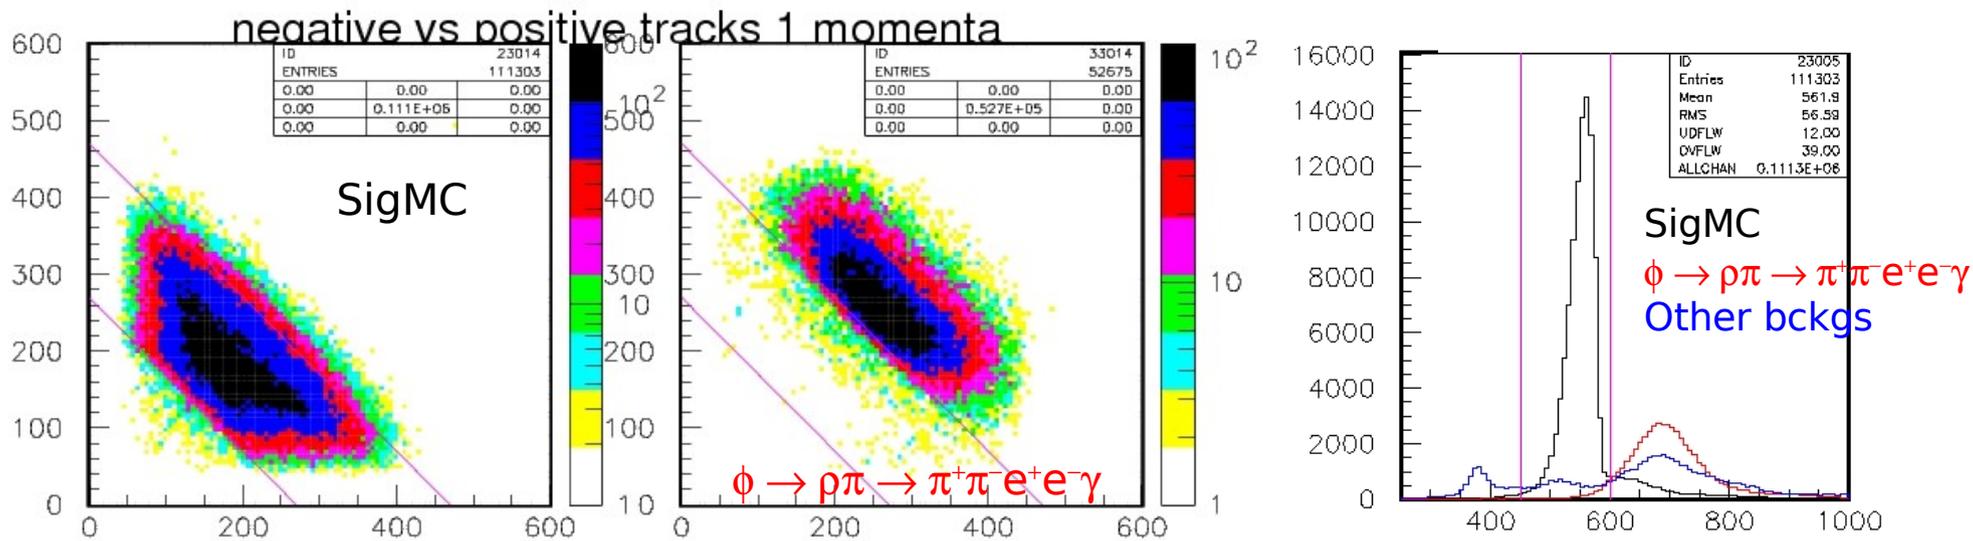

Rec. old

Rec. new

Still need fixes

pmod1 neg vs pos

sum of momenta rec

Signal MC from private production  
Backgrounds from MC2005 mrc

Ordered tracks allow studies  
of momenta, curvatures,  
invariant mass, angles etc.

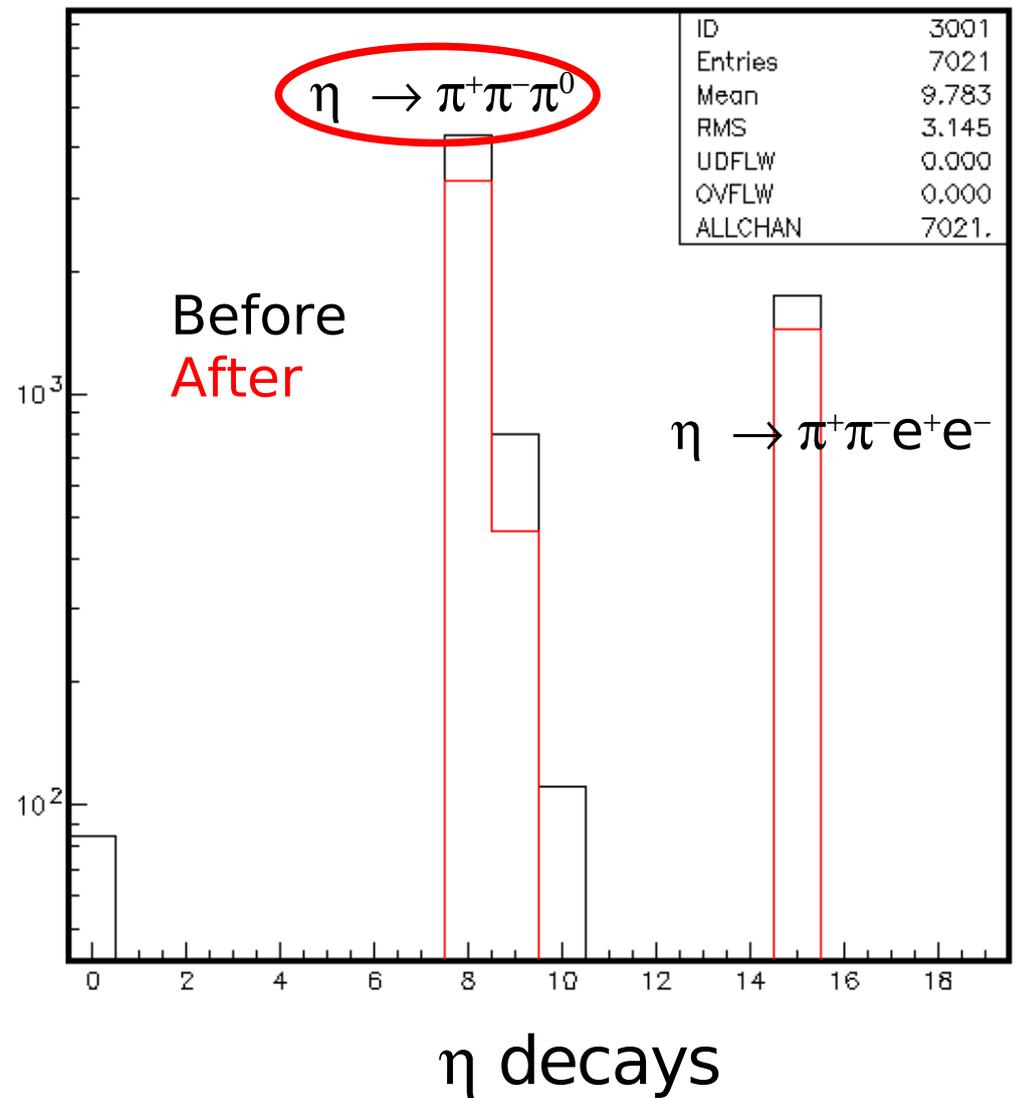

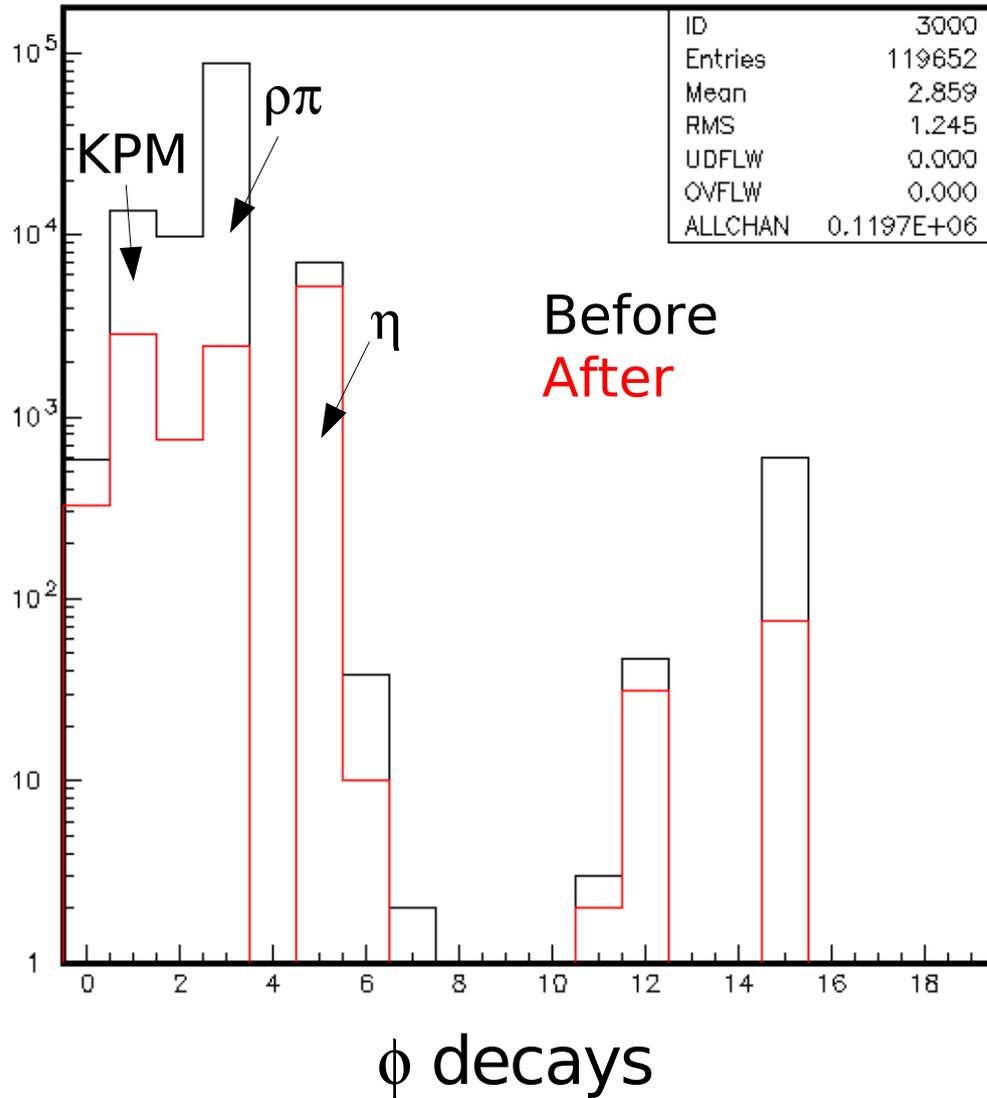

The best are:

$$450 < \sum_i |p_i| < 600 \text{ MeV}$$

$$270 < |p_{1+}| + |p_{1-}| < 470 \text{ MeV}$$

pmod1 neg vs pos

After the new cuts  $\phi \rightarrow \rho\pi \rightarrow \pi^+\pi^-e^+e^-\gamma$  isn't anymore the main source of background

# Efficiency of the new cuts

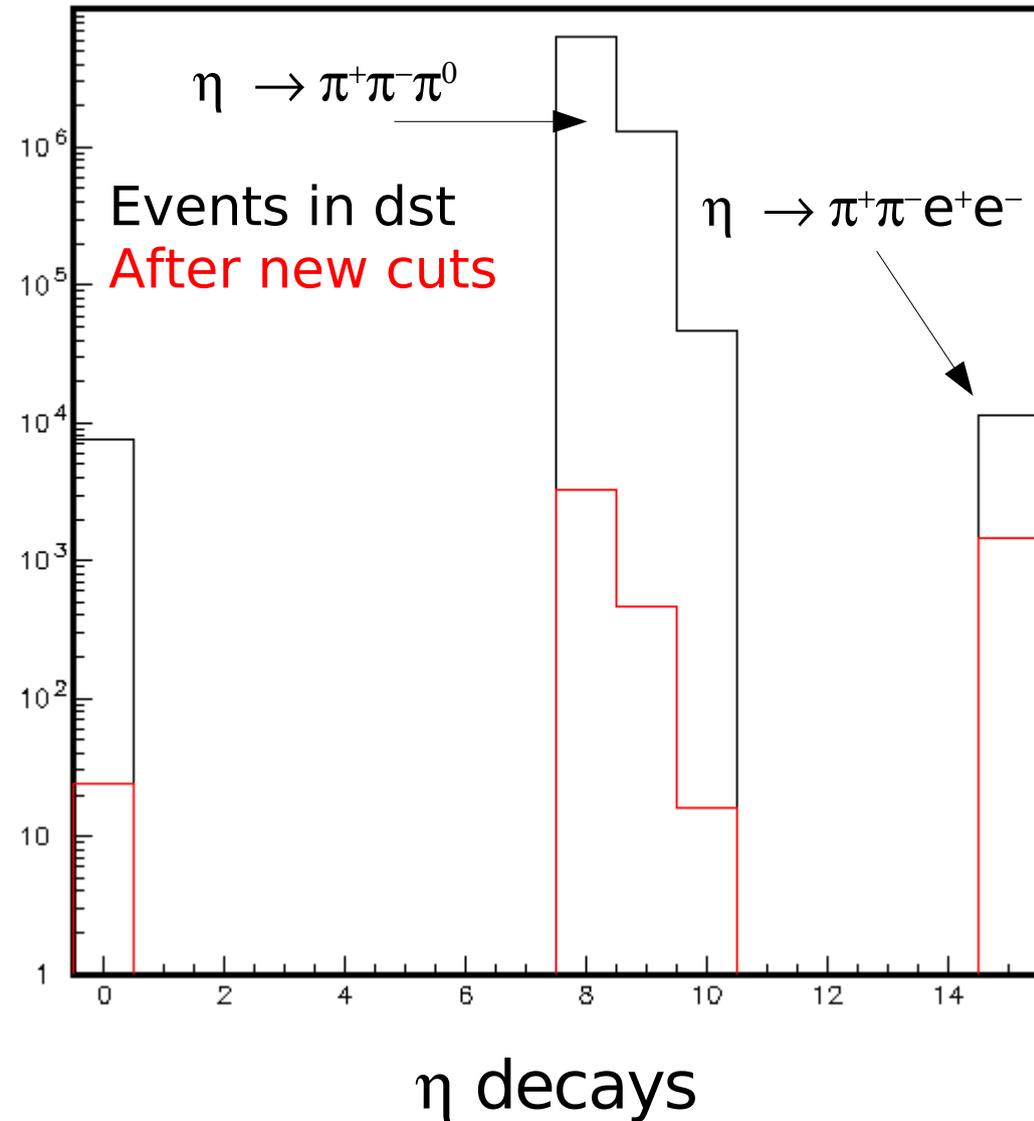

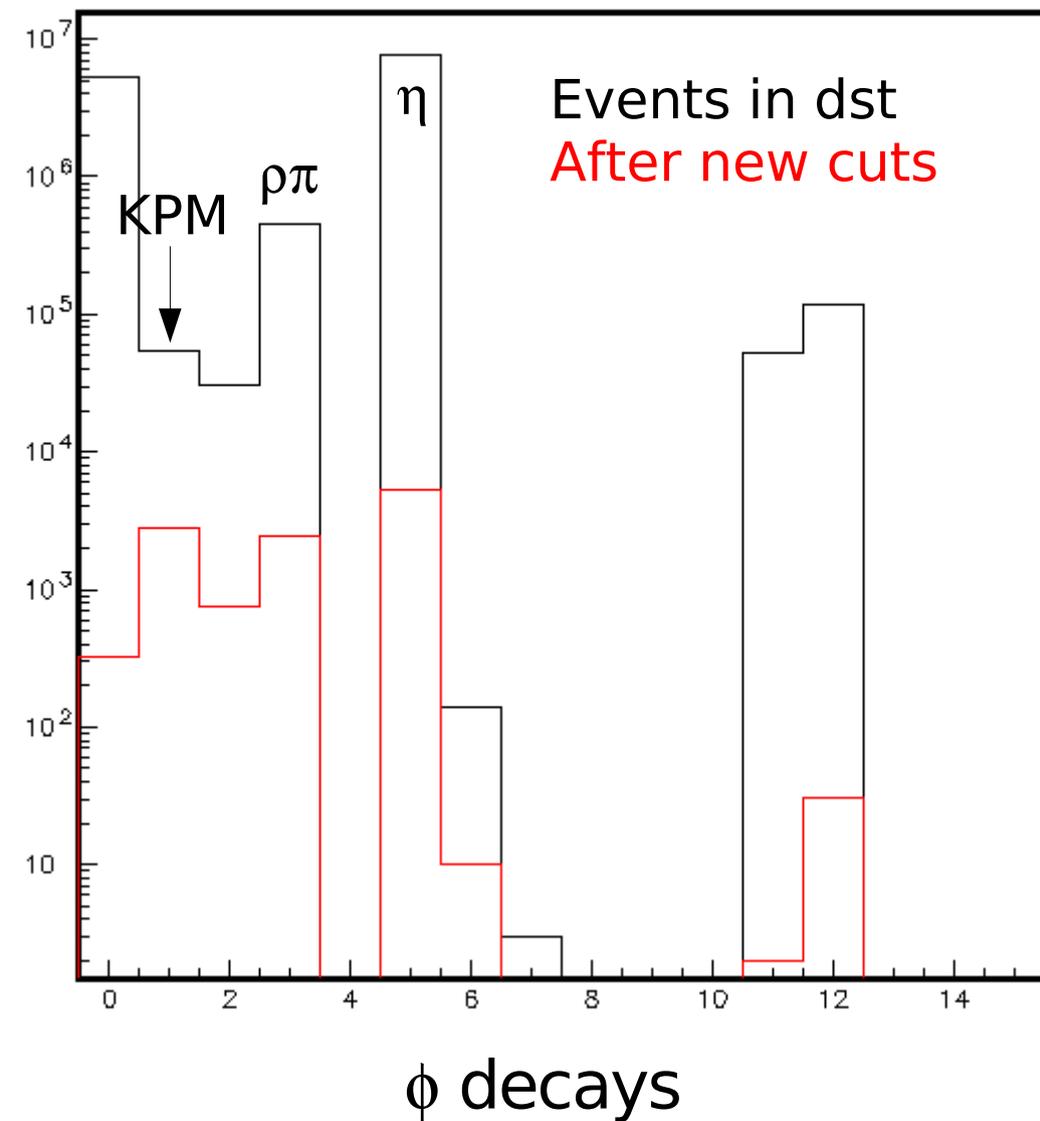

Number of events before and after applying the new cuts

ETA4CTAG ⊕ checks on tracks

	before	after	
all	119055	11666	0.0331 +/- 0.0003
others	42786	2489	0.0581 +/- 0.0011
signal	1738	1448	0.8331 +/- 0.0296
$\rho\pi$ ( $\pi^0$ Dalitz)	56669	1593	0.0281 +/- 0.0007
$\eta \rightarrow \pi^+\pi^-\pi^0$	4285	3296	0.7691 +/- 0.0178
KPM	13577	2840	0.2091 +/- 0.0043
Signal private MC	120662	101291	0.8394 +/- 0.0035

Main background is  $\eta \rightarrow \pi^+\pi^-\pi^0$

# Global efficiencies

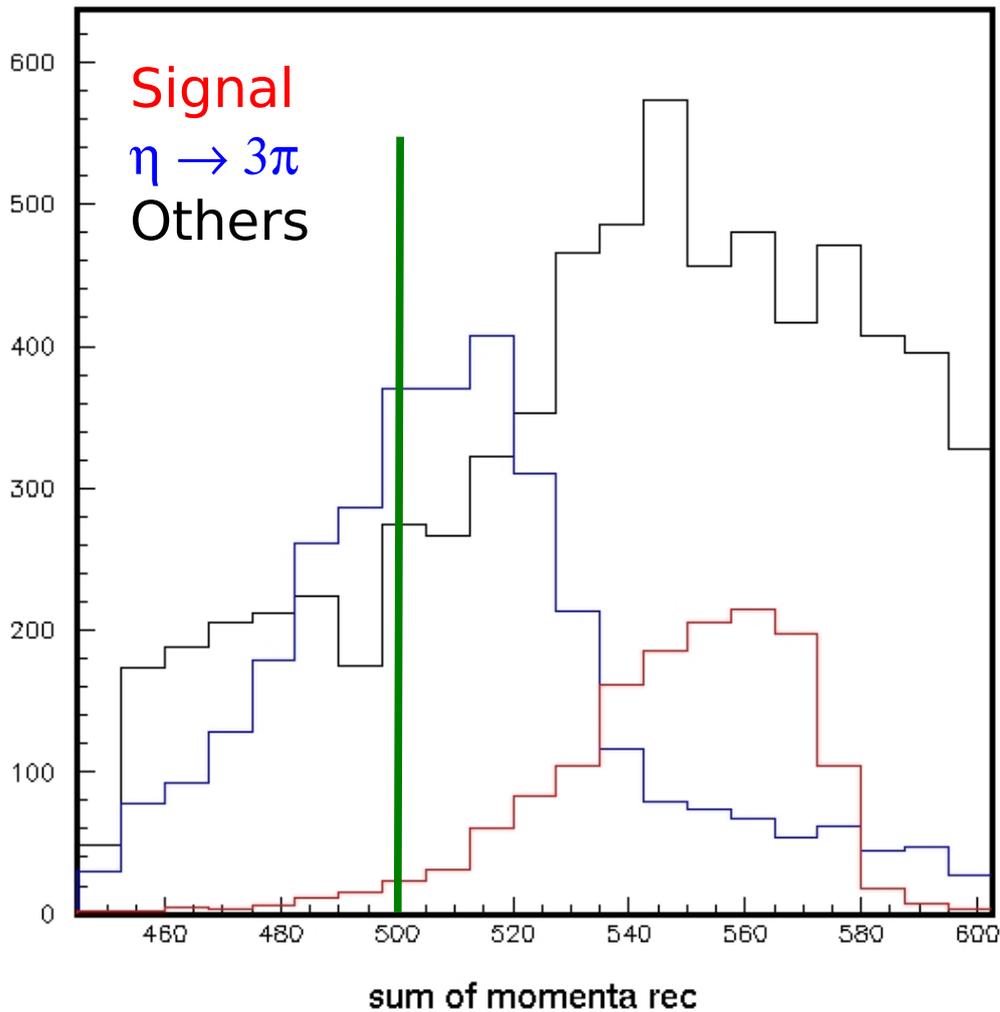

MC2005 mrc allphys

# ***Global efficiencies***

	After new cuts	Events in dst	
Signal	1448	11204	0.129(3)
$\rho\pi$ ( $\pi^0$ Dalitz)	1593	112075	0.0142(3)
$\eta \rightarrow \pi^+\pi^-\pi^0$	3296	6285196	0.000524(9)
KPM	2840	54573	0.052(1)
Others	2489	7155042	0.000348(7)
Private MC	101291	799773	0.1266(4)

Efficiency of  
ETA4CTAG  $\oplus$  checks on tracks  $\oplus$  new cuts

# $\eta \rightarrow 3\pi$

$\Sigma|p_i| > \text{“Cut” MeV}$

Cut	450	500
Signal	1448	1398
$\rho\pi$ ( $\pi^0$ Dalitz)	1593	1425
$\eta \rightarrow \pi^+\pi^-\pi^0$	3296	2117
KPM	2840	2035
Others	2489	2154

More fine tuning is possible: need feedback from data

# ***$\eta$ mass from kinematic fit***

**Warning!** Kinematic performed only for events with ntracks = 4  
Possible to recover events with ntracks > 4

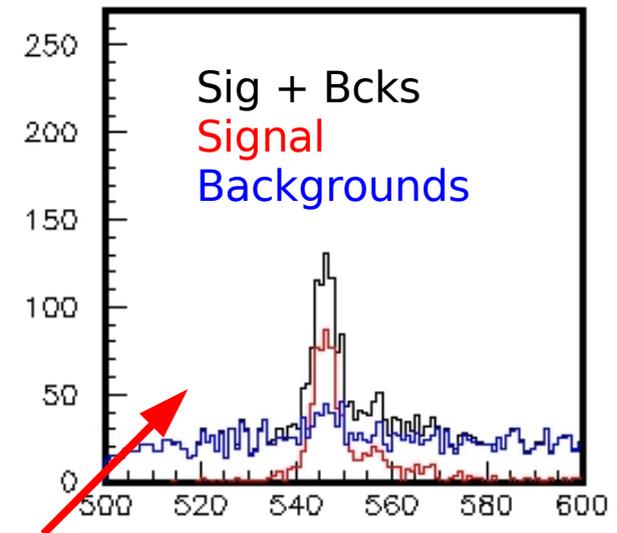

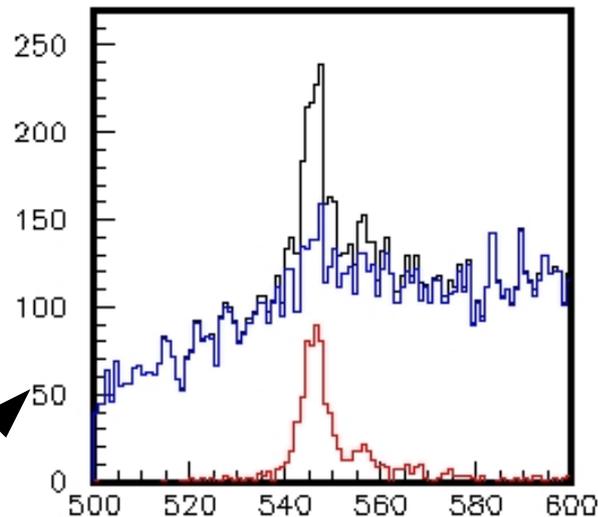

Signal

1448 → 829

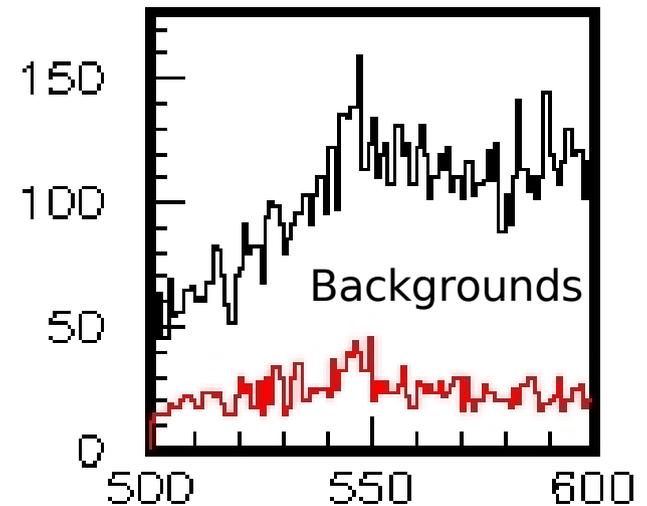

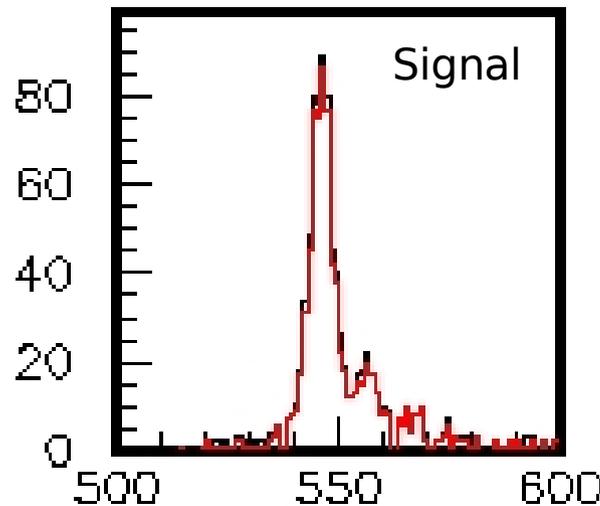

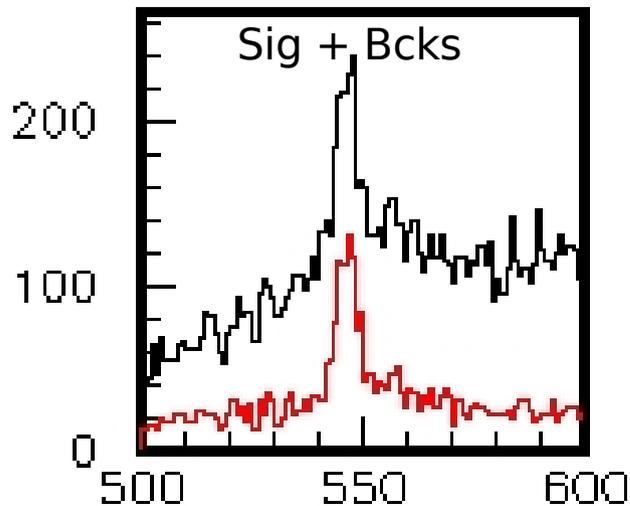

Bcks

10218 → 6283

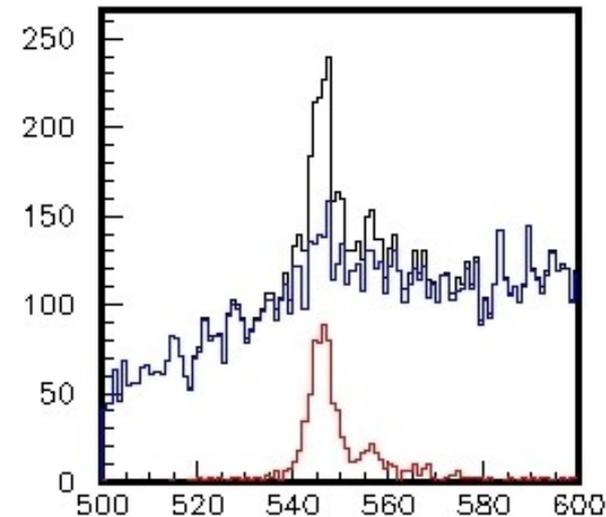

Before cuts on momenta

After cuts on momenta

# ***$\eta$ mass from kinematic fit***

**Warning!** Kinematic performed only for events with ntracks = 4

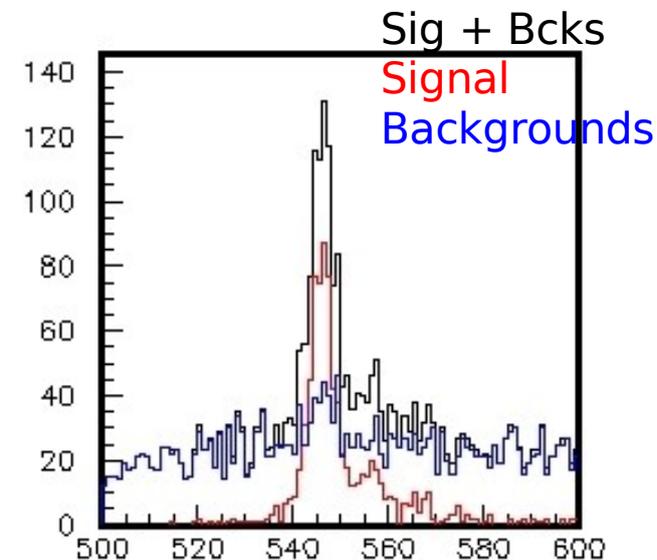

Before cuts  
on momenta

[540:555] Mev

S/B=0.32      611 signal events

[542:552] Mev

S/B=0.42      540 signal events

After cuts  
on momenta

[540:555] Mev

S/B=1.21      579 signal events

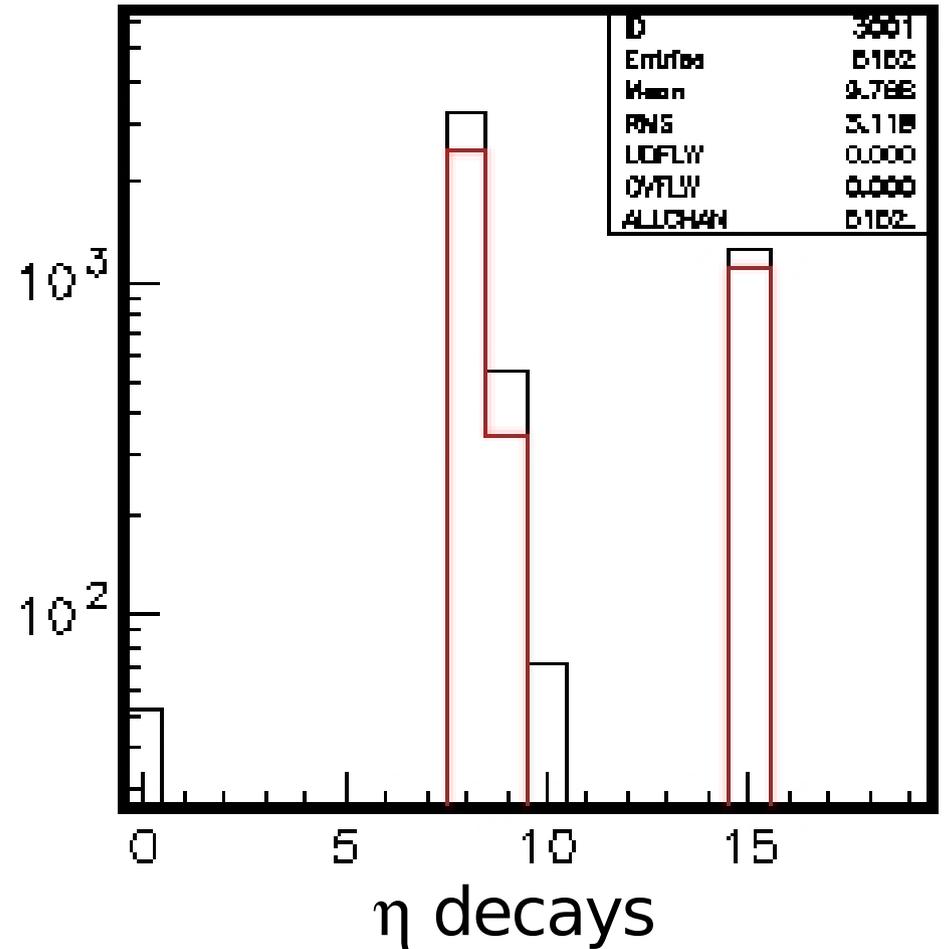

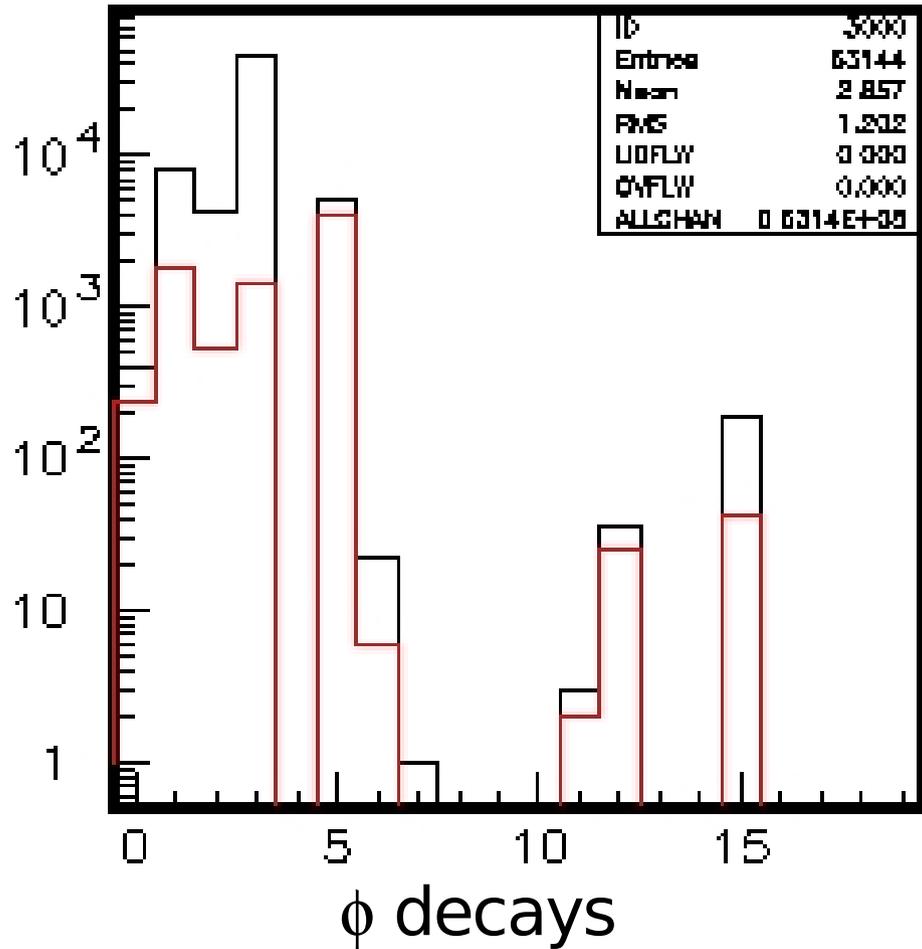

[542:552] Mev

S/B=1.48      512 signal events
