

Status report on $\eta \rightarrow \pi^-\pi^+\gamma$

PRE-SELECTION STUDIES

Marek Jacewicz, Biagio Di Micco
Camilla Di Donato

Phi decays working group meeting, 29 Sep 2008

Motivation

- BR, background to $\eta \rightarrow e^+ e^- \gamma, \eta \rightarrow \mu^+ \mu^- \gamma$
- Study of theoretical models
 - *B.Borasoy and R.Nissler, hep-ph arXiv:0705.0954*
Inconsistency in the old measurements of the γ spectrum
 - $\Gamma(\eta \rightarrow \pi^- \pi^+ e^+ e^-) / \Gamma(\eta \rightarrow \pi^- \pi^+ \gamma)$ Theor. accuracy: 1-2%
 - Dalitz plot (anomalous (triangle box) vs resonant contribution (VDM))

Signal / Background

Reaction:

$\phi \rightarrow \eta\gamma, \eta \rightarrow \pi^-\pi^+\gamma$
 $\phi \rightarrow \eta\gamma, \eta \rightarrow \pi^-\pi^+\pi^0$
 $\phi \rightarrow \eta\gamma, \eta \rightarrow e^+e^-\gamma$
 $\phi \rightarrow \pi^+\pi^-\pi^0$
 $e^+e^- \rightarrow \omega\pi^0$

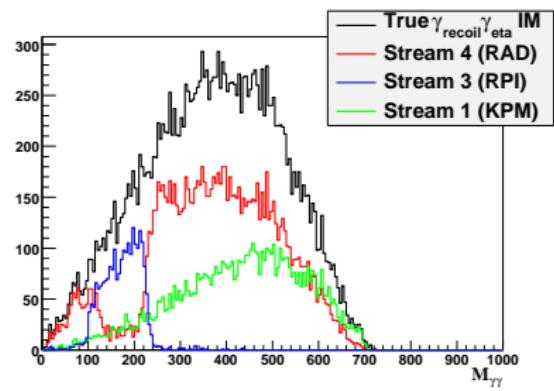

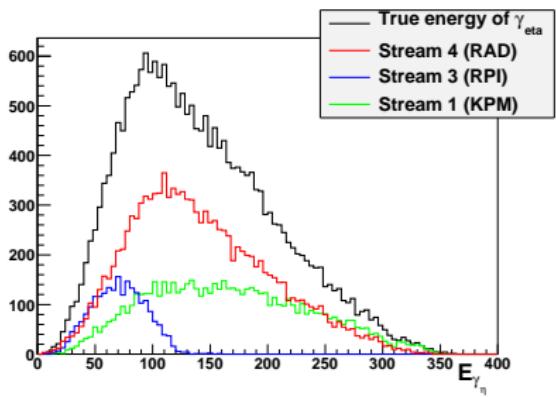

X-section $\sigma[\mu b]$

2.04×10^{-3}
 9.87×10^{-3}
 0.30×10^{-3}
0.46
 0.14×10^{-3}

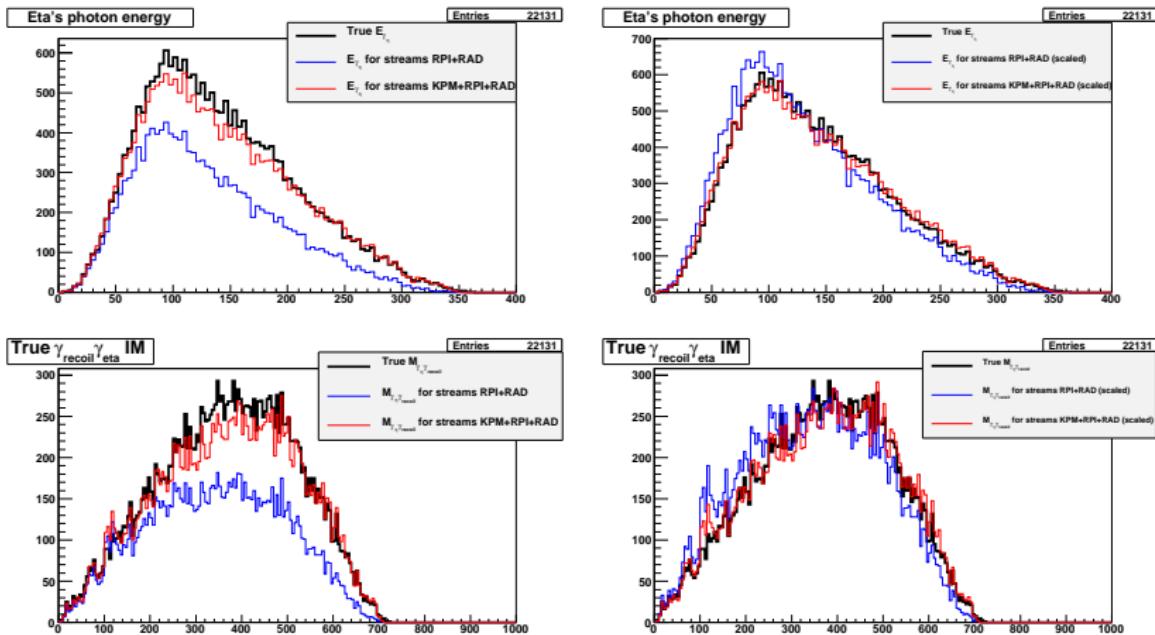

- Charged η decays (most frequent):

$\eta \rightarrow \pi^-\pi^+\pi^0 \quad (22.73 \pm 0.28) \times 10^{-2}$
 $\eta \rightarrow \pi^-\pi^+\gamma \quad (4.60 \pm 0.16) \times 10^{-2}$
 $\eta \rightarrow e^+e^-\gamma \quad (6.8 \pm 0.8) \times 10^{-3}$
 $\eta \rightarrow \mu^+\mu^-\gamma \quad (3.1 \pm 0.4) \times 10^{-4}$

Correlation for the stream 1 : KPM

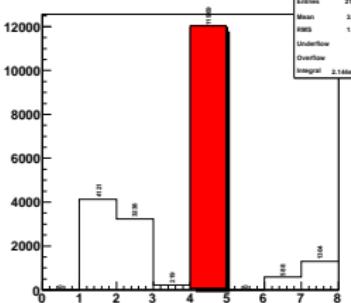

Correlation for the stream 2 : KLS

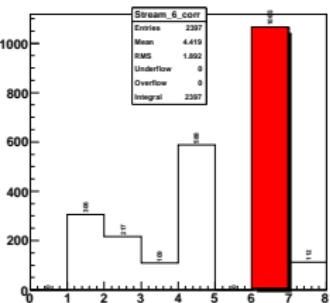

Correlation for the stream 3 : RPI

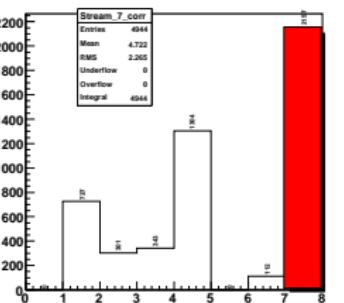

Correlation for the stream 4 : RAD

Correlation for the stream 6 : UFO

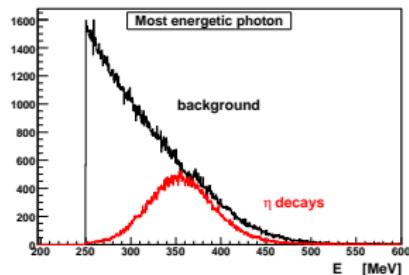

Correlation for the stream 7 : BHA

Preselection 1

- $\phi \rightarrow \eta\gamma \longrightarrow$
 - $\eta \rightarrow \pi^-\pi^+\gamma$ *signal*
 - $\eta \rightarrow \pi^-\pi^+\pi^0$ *normalization*
 - $\eta \rightarrow e^+e^-\gamma$ *for later*
- no kinematical fit (instead find constraints that pick out all signals)
- MC 2005 (all phys), runs: 34410 \div 34499, $L_{int} = 12.7 \text{ pb}^{-1}$
- Running: RAD , RPI & \overline{RAD} ,
 KPM & \overline{RAD} & \overline{RPI}
- ≥ 2 prompt photons $|t_{cl}-l_{cl}/c| < 5\sigma_t$
- most energetic photon with $E_\gamma \geq 250$ MeV assumed 'recoil'
- ≥ 1 vertex with two tracks and balanced charge, selecting closest to the IP

Preselection 2

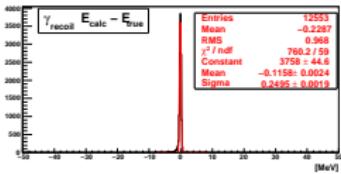

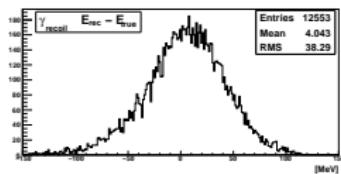

Calculation of E_{γ}^{recoil}

- Good angular but bad energy resolution for photons
- Help with 2-body kinematics of $\phi \rightarrow \eta\gamma$

$$\vec{p}_\eta = \vec{p}_\phi - \vec{p}_\gamma$$

$$E_\gamma = \frac{m_\phi^2 - m_\eta^2}{2 \cdot (E_\phi - |\vec{p}_\phi| \cdot \cos \theta)}$$

where $\cos \theta$ is an angle between ϕ and γ^{recoil}

Preselection 3

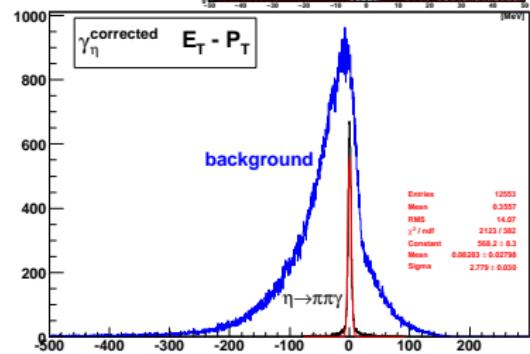

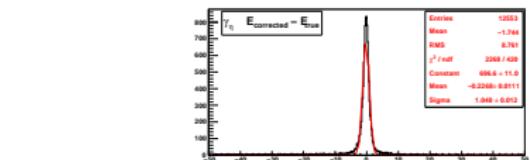

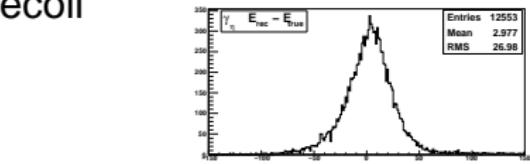

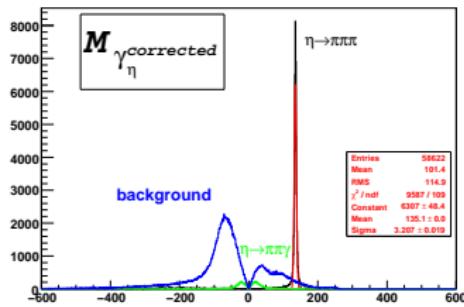

Calculation of E_{γ_η}

Having corrected the energy of the recoil photon we can calculate

$$\mathbb{P}_{\gamma_\eta}^{calc} = \mathbb{P}_\Phi - \mathbb{P}_{\pi^+} - \mathbb{P}_{\pi^-} - \mathbb{P}_\gamma^{recoil}$$

and look at the energy $E_{\gamma_\eta}^{calc}$:

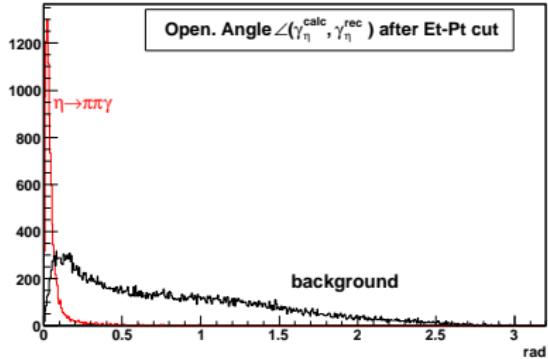

Possible constraints:

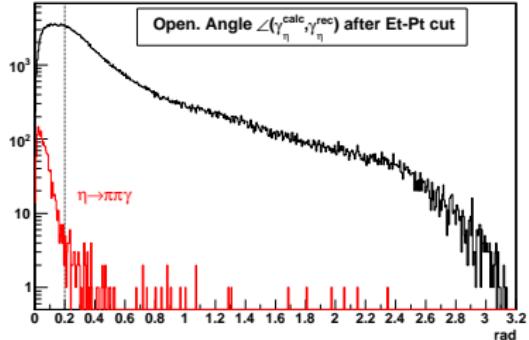

Preselection 4

- From candidates - neutral clusters, we select the closest to $\mathbb{P}_{\gamma\eta}^{\text{calc}}$
- Opening angle to the calculated γ_η effectively rejects background

RAD STREAM

RPI STREAM

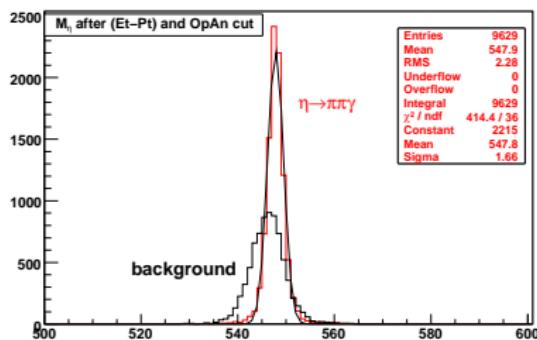

Result

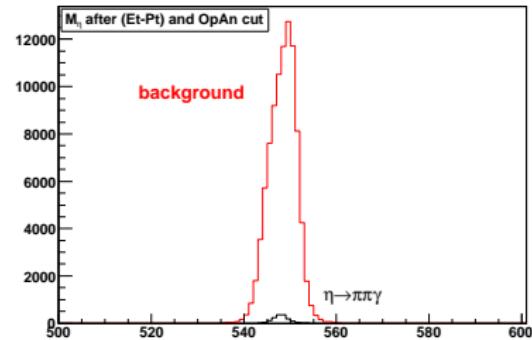

Invariant mass of η

- For the calculation of the M_η one can correct the photon energy using calculated value

Statistics 1

	total on DST	pre-selection ≥ 2 prompt clusters	Event signature (tracks)
RAD			
$\eta \rightarrow \pi^- \pi^+ \gamma$	1194777	383475	
	22131	17619 (80%)	12553 (57%)
$\eta \rightarrow \pi^- \pi^+ \pi^0$	105791	90089 (85%)	58622 (55%)
$\eta \rightarrow e^+ e^- \gamma$	839	684 (81%)	421 (50%)
background	1060351	273177 (26%)	230217 (22%)
RPI			
$\eta \rightarrow \pi^- \pi^+ \gamma$	3647348	1203355	
	2032	1691 (83%)	1549 (76%)
$\eta \rightarrow \pi^- \pi^+ \pi^0$	39	30 (77%)	20
$\eta \rightarrow e^+ e^- \gamma$	17	14 (82%)	14
background		1201613 (33%)	1145623 (31%)
KPM			
$\eta \rightarrow \pi^- \pi^+ \gamma$	12370050	92491	
	2221	1190 (54%)	588 (26%)
$\eta \rightarrow \pi^- \pi^+ \pi^0$	13703	8133 (59%)	3879 (28%)
$\eta \rightarrow e^+ e^- \gamma$	128	96 (75%)	68 (53%)
background		79690	43577

Per-cent values are calculated w.r. to the total number of the events for given stream
 (and NOT to the total value given by the BR)

Statistics 2

	M_γ (135 ± 15 MeV)	Et-Pt (-10 MeV ÷ 10 MeV)	Opening Angle (0 ÷ 0.2 rad)
RAD $\eta \rightarrow \pi^- \pi^+ \gamma$ $\eta \rightarrow \pi^- \pi^+ \pi^0$ background	46181 (44%) 5745 (0.5%)	10321 (47%) 40533 (4%)	9629 (43%) 7595 (0.7%)
RPI $\eta \rightarrow \pi^- \pi^+ \gamma$ $\eta \rightarrow \pi^- \pi^+ \pi^0$ background	— —	1439 (71%) 211304 (6%)	1359 (67%) 84089 (2%)
KPM $\eta \rightarrow \pi^- \pi^+ \gamma$ $\eta \rightarrow \pi^- \pi^+ \pi^0$ background	1225 (9%) 1434	259 (12%) 2683	182 (8%) 61

Per-cent values are calculated w.r. to the total number of the events for given stream
(and NOT to the total value given by the BR)

Track selection

- to use vertex bank or not? (at the pre-selection level)
 - in 20% of selected vertexes at least for one track pion hypothesis is wrong (muon)
 - lower efficiency
 - are the track parameters better? For pions, electrons ...
- if not more work is needed to investigate the alternatives

Conclusions

- plan was to analyze events from 3 streams: RAD, RPI, KPM, but is KPM worth the effort?
- worse track reconstruction in KPM and hence rejection of signal events (left with > 1% of total BR)
- pre-selection criteria without kinematic fit
- good background reduction in RAD, KPM
- still flooded with background in RPI

TO DO:

- track selection
- add $\eta \rightarrow e^+ e^- \gamma$ to pre-selection
- repeat analysis of Ilaria (RAD stream only)

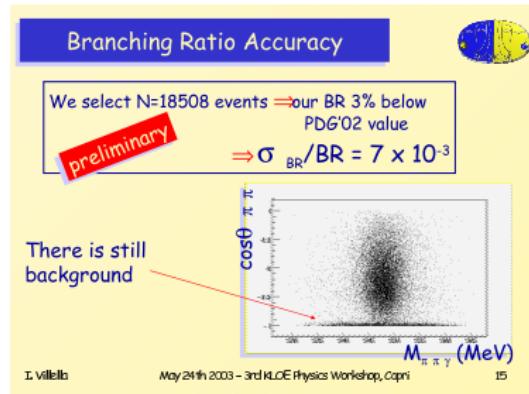

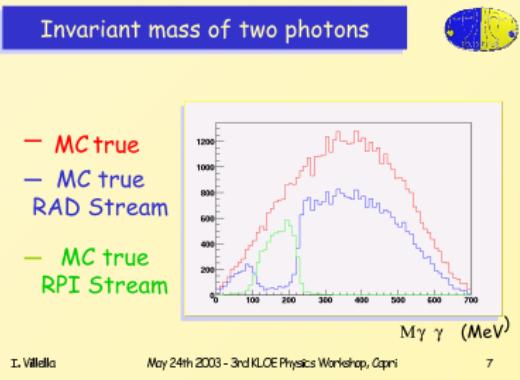

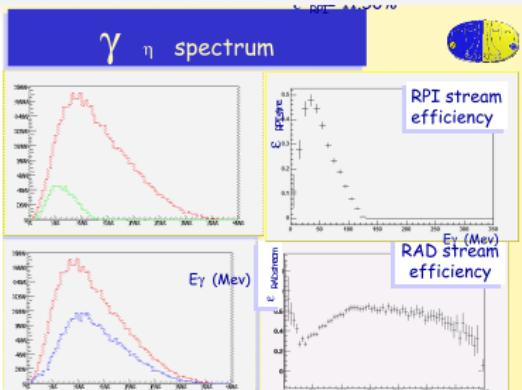

Spares

Introduction

- Previous analysis in KLOE:

Ilaria Villella (Uni. di Napoli) presented during Capri'03:

- $L_{int} = 29 \text{ pb}^{-1}$, selected 18508 events
- Could not use single streaming algorithm because all of them cut into kinematical distributions
- Planned analysis on 100 pb^{-1} (?)
