

# Progress on NNLO subtraction

Vittorio Del Duca  
INFN Torino

RADCOR 3 October 2005

# NLO features

- Jet structure: final-state collinear radiation
- PDF evolution: initial-state collinear radiation
- Opening of new channels
- Reduced sensitivity to fictitious input scales:  $\mu_R, \mu_F$ 
  - predictive normalisation of observables
    - first step toward precision measurements
    - accurate estimate of signal and background for Higgs and new physics
- Matching with parton-shower MC's: **MC@NLO**

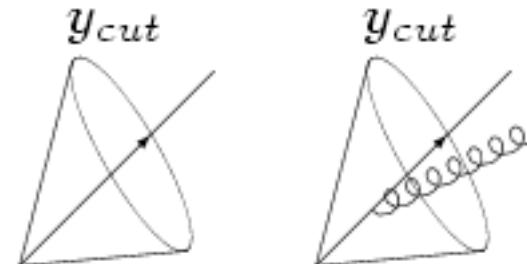

# Jet structure

the jet non-trivial structure shows up first to NLO

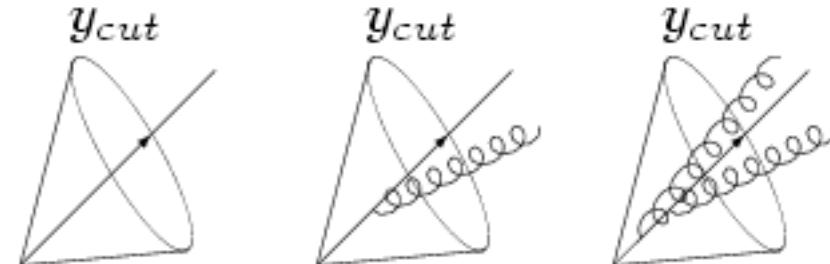

leading order

NLO

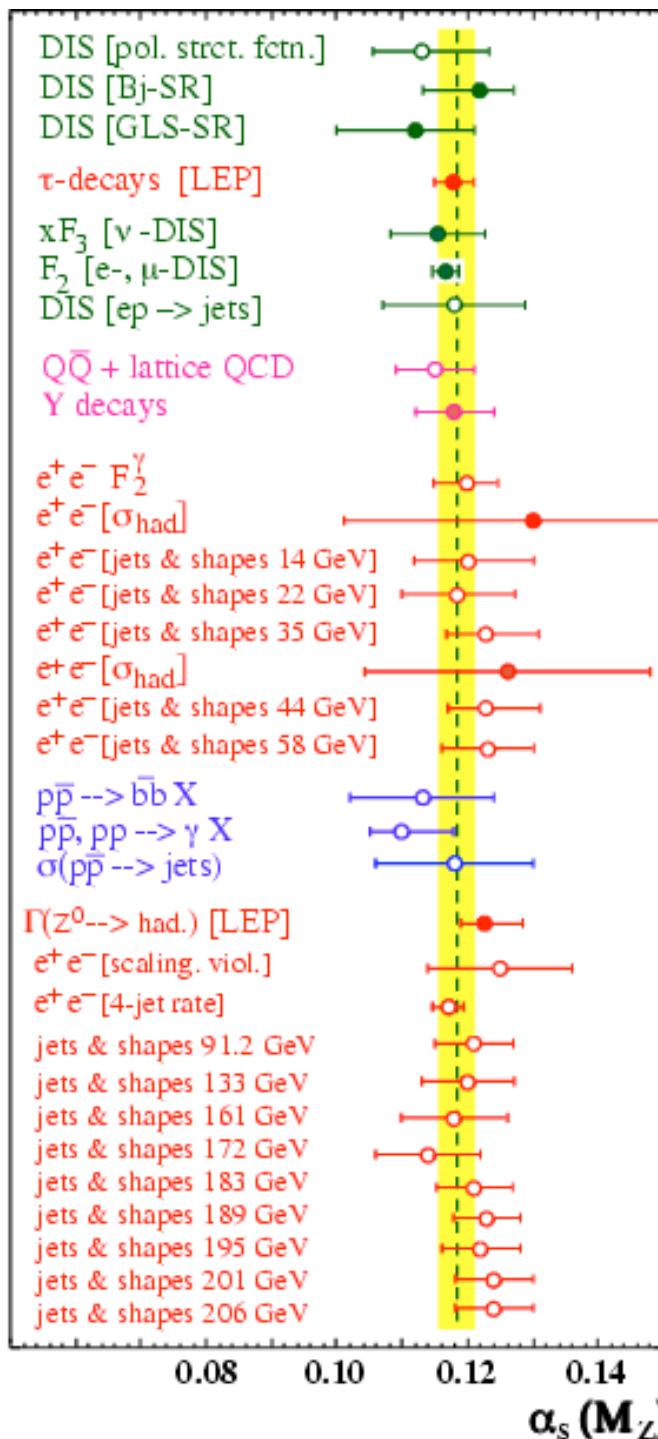

NNLO

# NNLO corrections may be relevant if

- the main source of uncertainty in extracting info from data is due to NLO theory:  $\alpha_S$  measurements
- NLO corrections are large:  
Higgs production from gluon fusion in hadron collisions
- NLO uncertainty bands are too large to test theory vs. data:  $b$  production in hadron collisions
- NLO is effectively leading order:  
energy distributions in jet cones

in short, NNLO is relevant where NLO fails to do its job

filled symbols are **NNLO** results

# Summary of $\alpha_S(M_Z)$

S. Bethke hep-ex/0407021

world average of  $\alpha_S(M_Z)$

using  $\overline{\text{MS}}$  and **NNLO** results only

$$\alpha_S(M_Z) = 0.1182 \pm 0.0027$$

$$(\text{cf. 2002 } \alpha_S(M_Z) = 0.1183 \pm 0.0027)$$

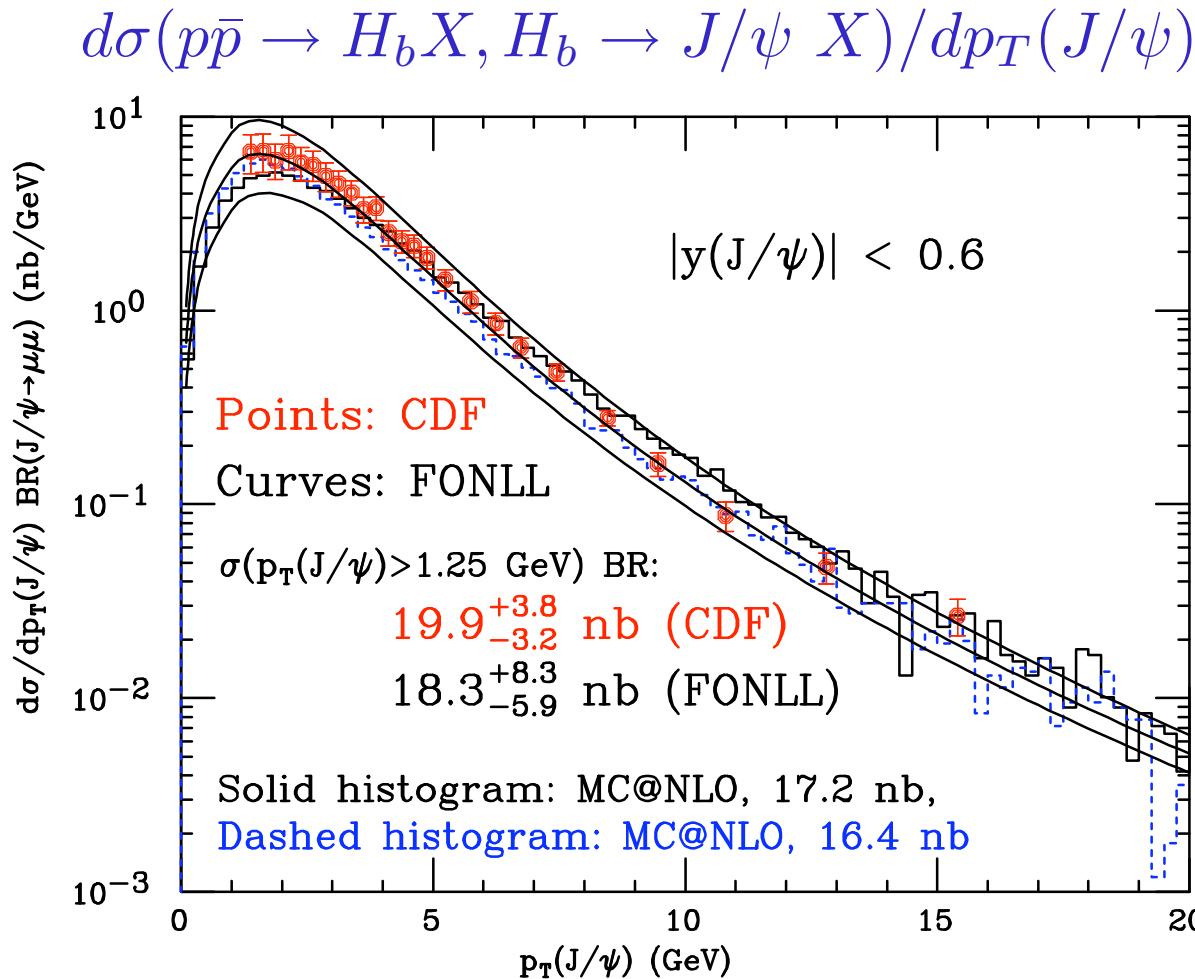

outcome almost identical

because new entries wrt 2002

- LEP jet shape observables and  
4-jet rate, and HERA jet rates  
and shape variables - are NLO )

# Is NLO enough to describe data ?

$b$  cross section in  $p\bar{p}$  collisions at 1.96 TeV

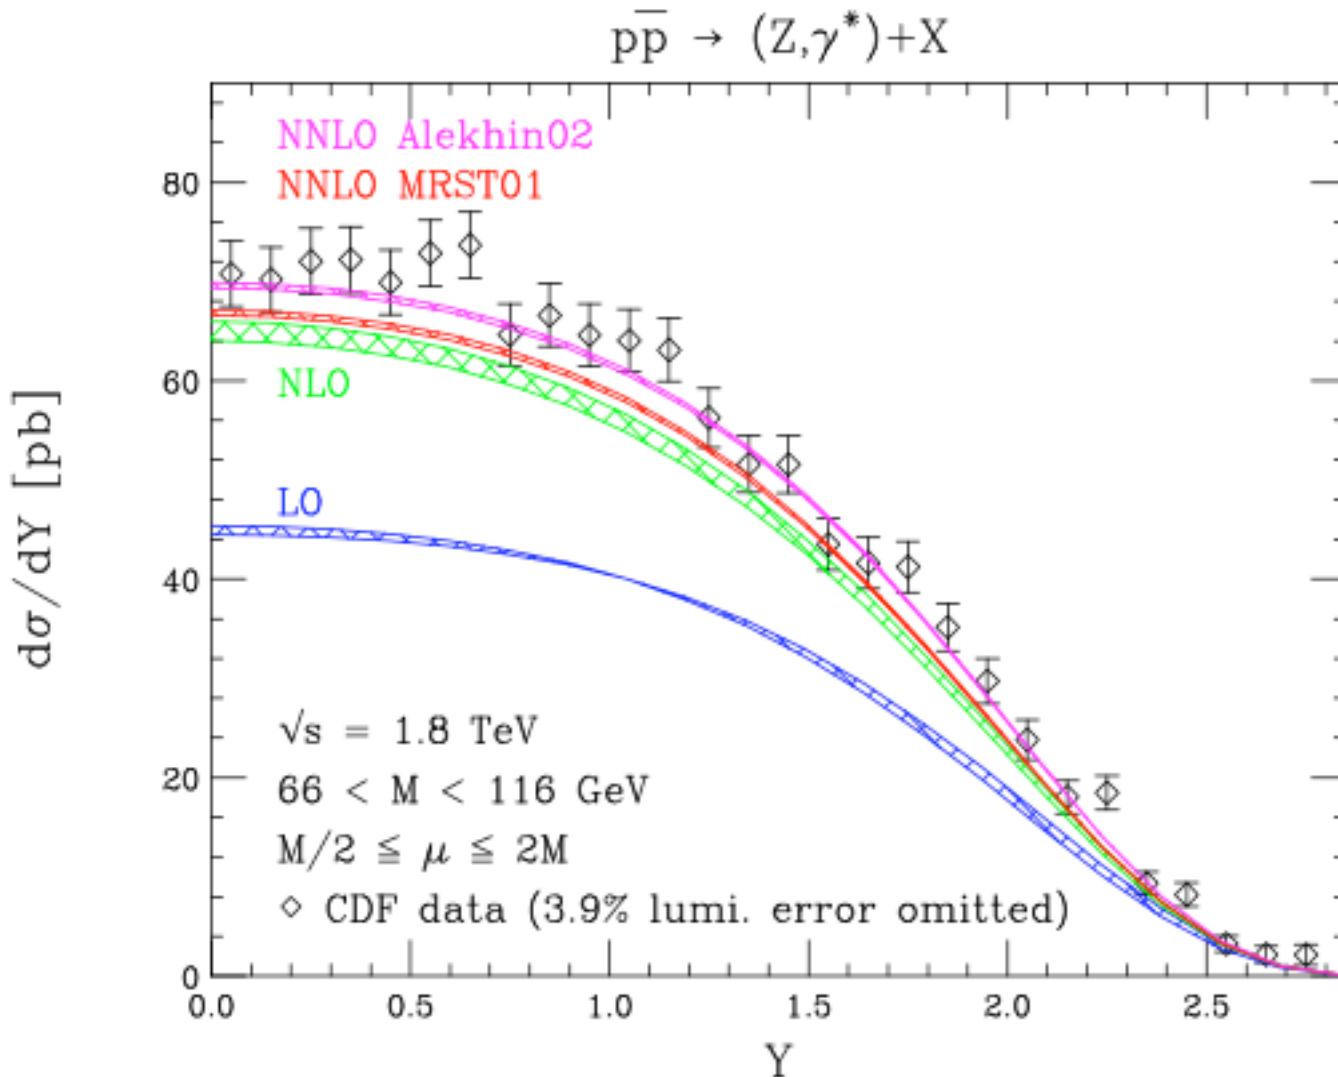

NLO + NLL

good agreement  
with data (with use  
of updated FF's by  
Cacciari & Nason)

The CDF value in the  
inset was preliminary.  
The published value is  
(CDF hep-ex/0412071)  
 $19.4 \pm 0.3(\text{stat})^{+2.1}_{-1.9}(\text{syst}) \text{ nb}$

# Is NLO enough to describe data ?

di-lepton rapidity distribution for  $(Z, \gamma^*)$  production vs. Tevatron Run I data

LO and NLO curves are  
for the MRST PDF set  
no spin correlations

# Is NLO enough to describe data ?

Drell-Yan  $W$  cross section at LHC with leptonic decay of the  $W$

Cuts A  $\rightarrow |\eta^{(e)}| < 2.5, p_T^{(e)} > 20 \text{ GeV}, p_T^{(\nu)} > 20 \text{ GeV}$

Cuts B  $\rightarrow |\eta^{(e)}| < 2.5, p_T^{(e)} > 40 \text{ GeV}, p_T^{(\nu)} > 20 \text{ GeV}$

	LO	LO+HW	NLO	MC@NLO
Cuts A	0.5249 $\xrightarrow{-7.7\%}$	0.4843	0.4771 $\xrightarrow{+1.5\%}$	0.4845
	$\downarrow 5.4\%$		$\downarrow 7.0\%$	$\downarrow 6.3\%$
Cuts A, no spin	0.5535		0.5104	0.5151
Cuts B	0.0585 $\xrightarrow{+208\%}$	0.1218	0.1292 $\xrightarrow{+2.9\%}$	0.1329
	$\downarrow 29\%$		$\downarrow 16\%$	$\downarrow 18\%$
Cuts B, no spin	0.0752		0.1504	0.1570

$|\text{MC@NLO} - \text{NLO}| = \mathcal{O}(2\%)$

S. Frixione M.L. Mangano 2004

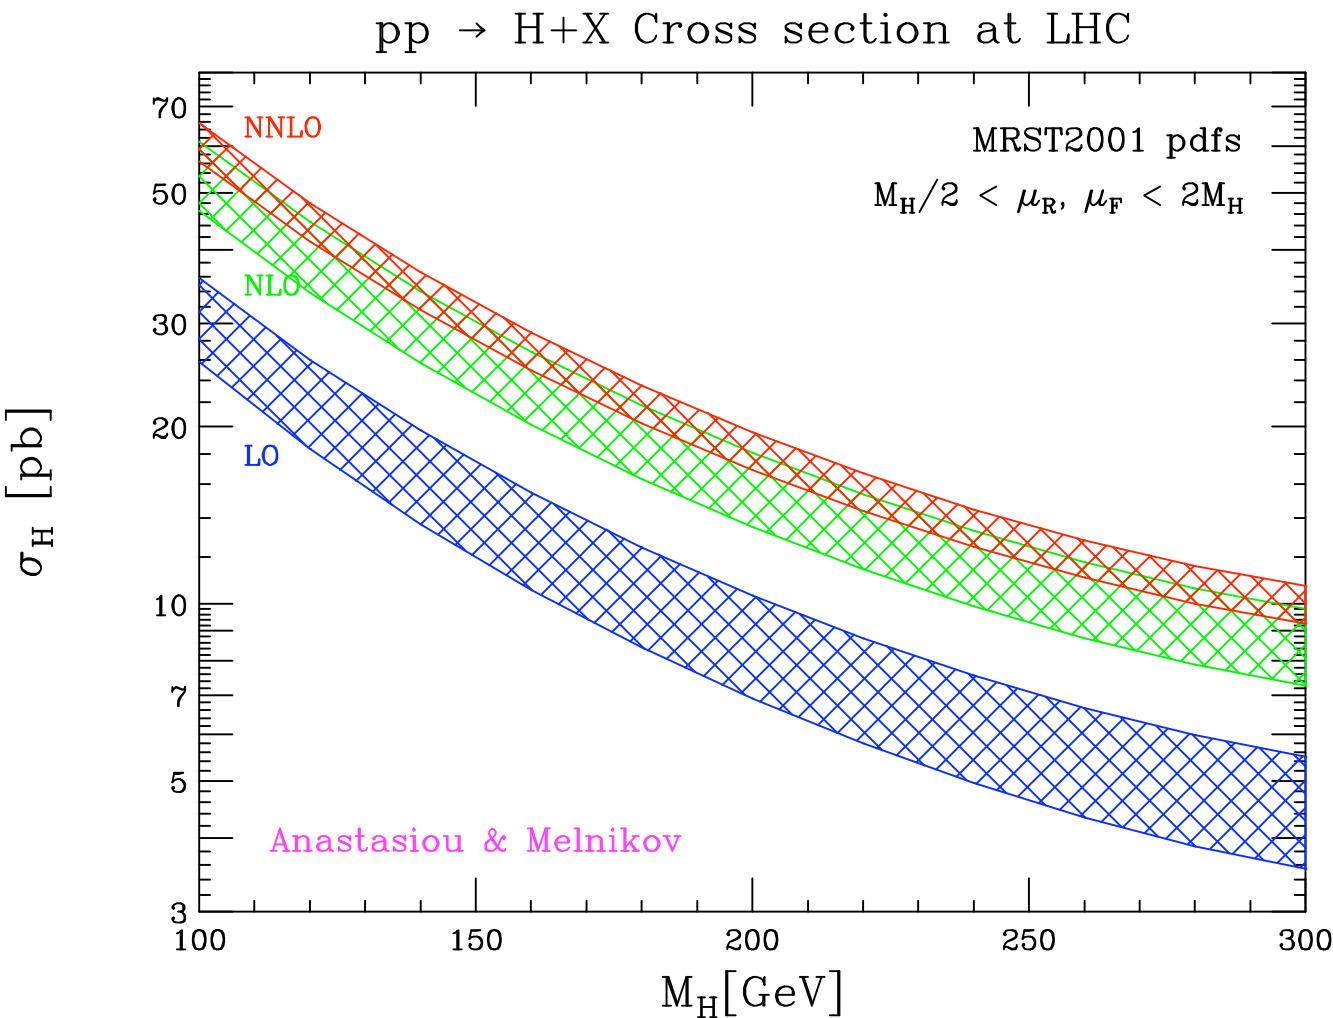

NNLO useless without spin correlations

Precisely evaluated Drell-Yan  $W, Z$  cross sections could be used as ``standard candles'' to measure the parton luminosity at LHC

# Is NLO enough to describe data ?

Total cross section for inclusive Higgs production at LHC

contour bands are lower  
 $\mu_R = 2M_H \quad \mu_F = M_H/2$

upper  
 $\mu_R = M_H/2 \quad \mu_F = 2M_H$

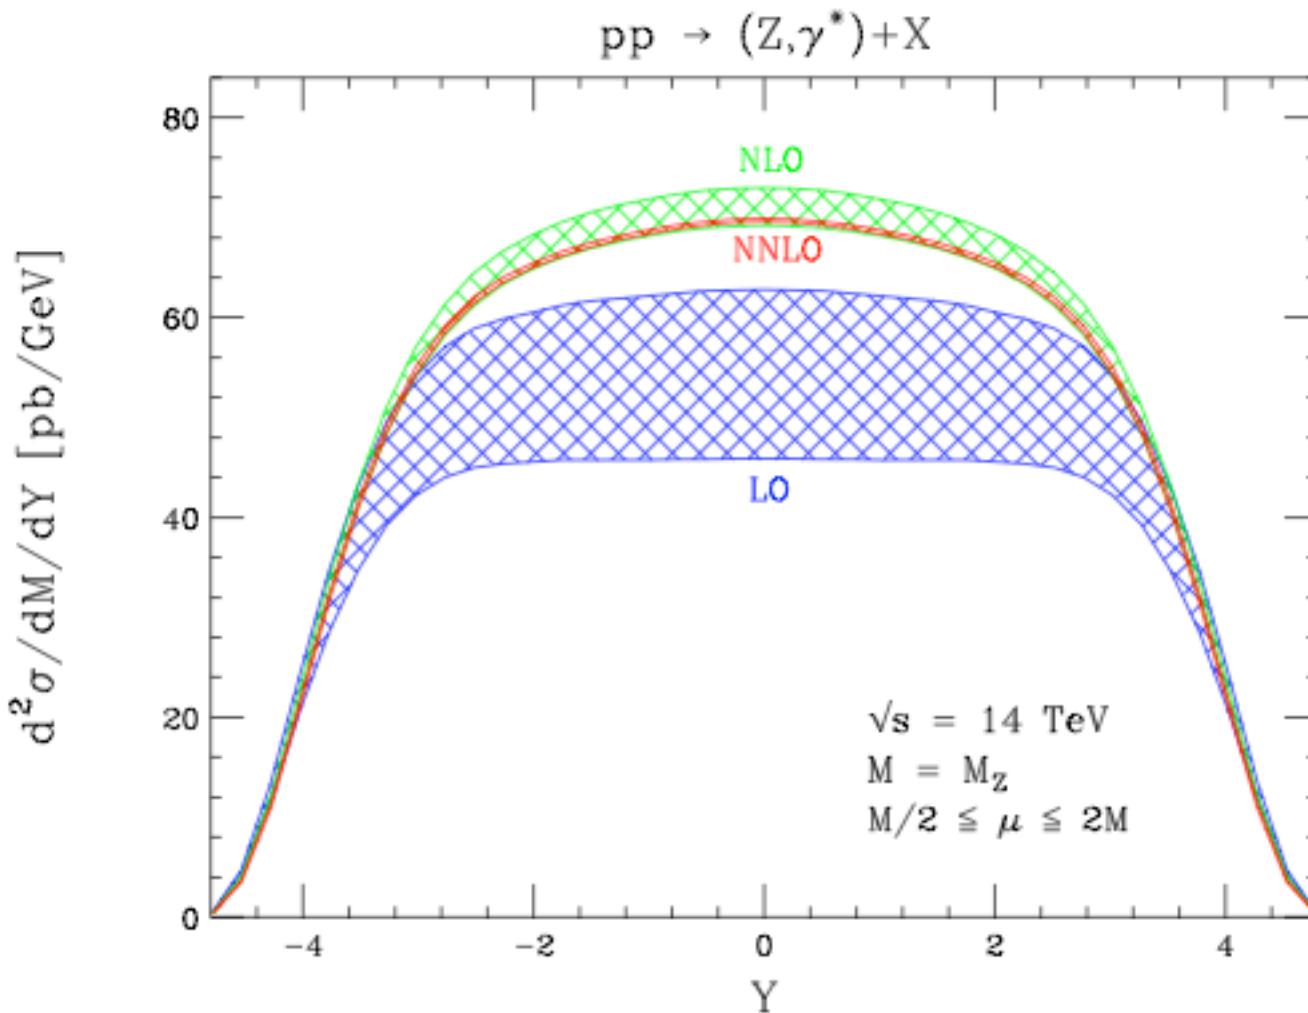

scale uncertainty is about 10%

NNLO prediction stabilises the perturbative series

# NNLO state of the art

- Drell-Yan  $W, Z$  production
- total cross section      Hamberg, van Neerven, Matsuura 1990  
                                  Harlander, Kilgore 2002
- rapidity distribution    Anastasiou et al. 2003
- Higgs production
- total cross section      Harlander, Kilgore; Anastasiou, Melnikov 2002
- fully differential cross section      Anastasiou, Melnikov, Petriello 2004
- $e^+e^- \rightarrow 3$  jets
- the  $1/N_c^2$  terms      the Gehrmanns, Glover 2004-5

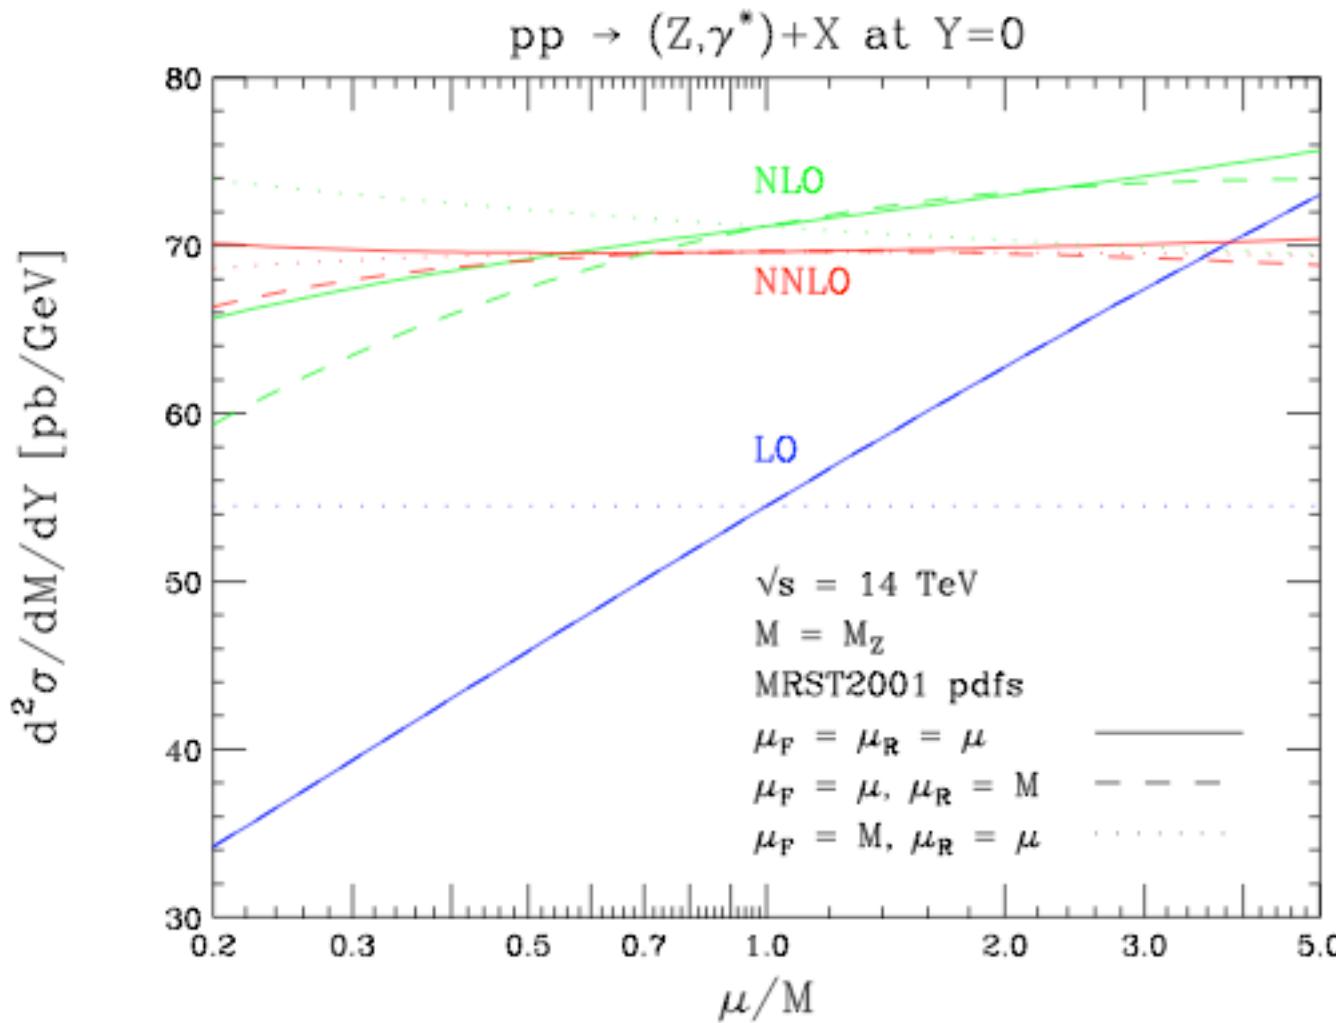

# NNLO Drell-Yan $Z$ production at LHC

Rapidity distribution for an on-shell  $Z$  boson

- 30%(15%) NLO increase wrt to LO at central Y's (at large Y's)  
NNLO decreases NLO by 1 – 2%
- scale variation:  $\approx 30\%$  at LO;  $\approx 6\%$  at NLO; less than 1% at NNLO

# Scale variations in Drell-Yan $Z$ production

solid: vary  $\mu_R$  and  $\mu_F$  together

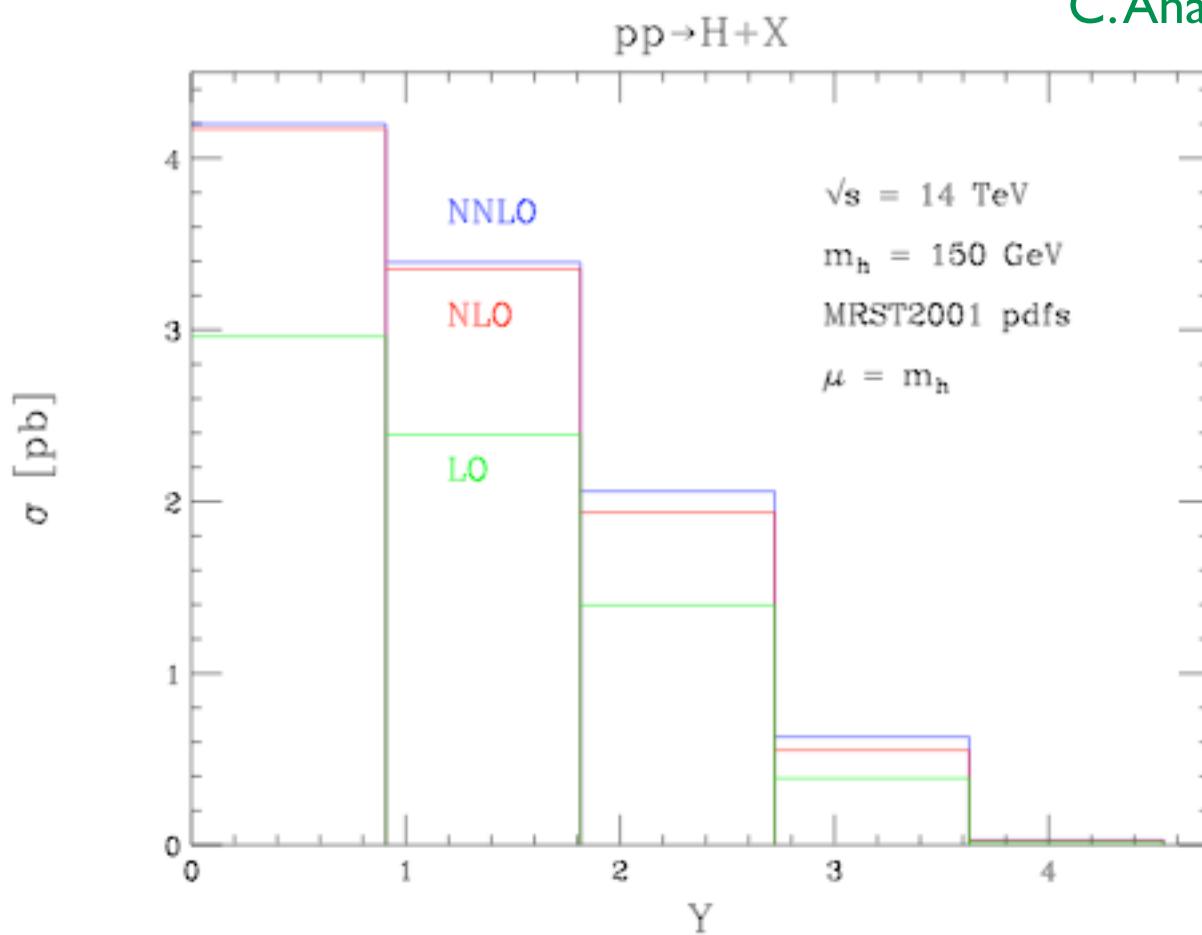

dashed: vary  $\mu_F$  only

dotted: vary  $\mu_R$  only

# Higgs production at LHC

a fully differential cross section:  
bin-integrated rapidity distribution, with a jet veto

C.Anastasiou K. Melnikov F.Petriello 2004

jet veto: require

$$R = 0.4$$

$$|\mathbf{p}_T^j| < p_T^{veto} = 40 \text{ GeV}$$

for 2 partons

$$R_{12}^2 = (\eta_1 - \eta_2)^2 + (\phi_1 - \phi_2)^2$$

$$\text{if } R_{12} > R$$

$$|\mathbf{p}_T^1|, |\mathbf{p}_T^2| < p_T^{veto}$$

$$\text{if } R_{12} < R$$

$$|\mathbf{p}_T^1 + \mathbf{p}_T^2| < p_T^{veto}$$

$M_H = 150 \text{ GeV}$  (jet veto relevant in the  $H \rightarrow W^+W^-$  decay channel)

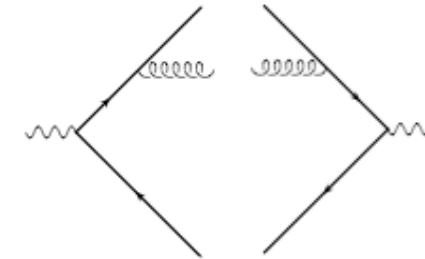

K factor is much smaller for the vetoed x-sect than for the inclusive one:  
average  $|\mathbf{p}_T^j|$  increases from **NLO** to **NNLO**: less x-sect passes the veto

# NLO assembly kit

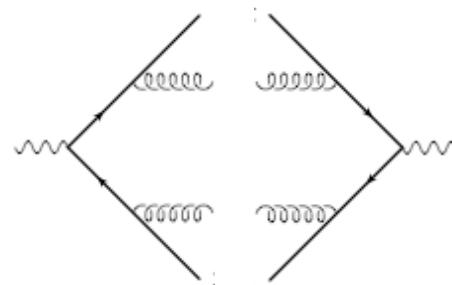

$e^+e^- \rightarrow 3 \text{ jets}$

leading order

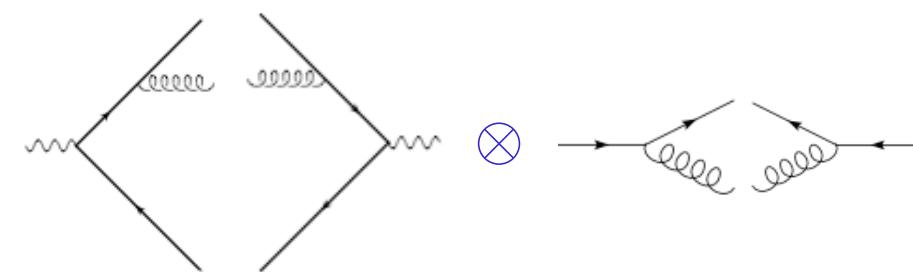

$$|\mathcal{M}_n^{\text{tree}}|^2$$

NLO real

IR

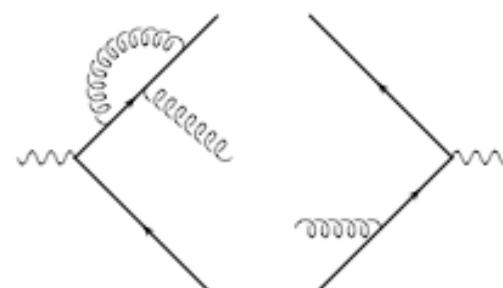

$$|\mathcal{M}_{n+1}^{\text{tree}}|^2$$

antenna

Kosower; Campbell Cullen & Glover

$$\sigma = \sigma^{\text{LO}} + \sigma^{\text{NLO}} = \int_m d\sigma_m^B J_m + \sigma^{\text{NLO}}$$

$$\sigma^{\text{NLO}} = \int_{m+1} d\sigma_{m+1}^R J_{m+1} + \int_m d\sigma_m^V J_m$$

the 2 terms on the rhs are divergent in  $d=4$

use universal IR structure to subtract divergences

$$\sigma^{\text{NLO}} = \int_{m+1} \left[ d\sigma_{m+1}^R J_{m+1} - d\sigma_{m+1}^{R,A} J_m \right] + \int_m \left[ d\sigma_m^V + \int_1 d\sigma_{m+1}^{R,A} \right] J_m$$

the 2 terms on the rhs are finite in  $d=4$

# Observable (jet) functions

$J_m$  vanishes when one parton becomes soft or collinear to another one

$$J_m(p_1, \dots, p_m) \rightarrow 0, \quad \text{if} \quad p_i \cdot p_j \rightarrow 0$$

→  $d\sigma_m^B$  is integrable over 1-parton IR phase space

$J_{m+1}$  vanishes when two partons become simultaneously soft and/or collinear

$$J_{m+1}(p_1, \dots, p_{m+1}) \rightarrow 0, \quad \text{if} \quad p_i \cdot p_j \text{ and } p_k \cdot p_l \rightarrow 0 \quad (i \neq k)$$

R and V are integrable over 2-parton IR phase space

observables are IR safe

$$J_{n+1}(p_1, \dots, p_j = \lambda q, \dots, p_{n+1}) \rightarrow J_n(p_1, \dots, p_{n+1}) \quad \text{if} \quad \lambda \rightarrow 0$$

$$J_{n+1}(p_1, \dots, p_i, \dots, p_j, \dots, p_{n+1}) \rightarrow J_n(p_1, \dots, p, \dots, p_{n+1}) \quad \text{if} \quad p_i \rightarrow zp, \quad p_j \rightarrow (1-z)p$$

for all  $n \geq m$

# NLO IR limits

collinear operator

$$C_{ir} |\mathcal{M}_{m+2}^{(0)}(p_i, p_r, \dots)|^2 \propto \frac{1}{s_{ir}} \langle \mathcal{M}_{m+1}(0)(p_{ir}, \dots) | \hat{P}_{f_i f_r}^{(0)} | \mathcal{M}_{m+1}(0)(p_{ir}, \dots) \rangle$$

soft operator

$$S_r |\mathcal{M}_{m+2}^{(0)}(p_r, \dots)|^2 \propto \frac{s_{ik}}{s_{ir} s_{rk}} \langle \mathcal{M}_{m+1}(0)(\dots) | T_i \cdot T_k | \mathcal{M}_{m+1}(0)(\dots) \rangle$$

counterterm  $\sum_r \left( \sum_{i \neq r} \frac{1}{2} C_{ir} + S_r \right) |\mathcal{M}_{m+2}^{(0)}(p_i, p_r, \dots)|^2$

performs double subtraction in overlapping regions

# NLO overlapping divergences

$C_{ir}S_r$  can be used to cancel double subtraction

$$C_{ir}(S_r - C_{ir}S_r) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

$$S_r(C_{ir} - C_{ir}S_r) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

the NLO counterterm

$$A_1 |\mathcal{M}_{m+2}^{(0)}|^2 = \sum_r \left[ \sum_{i \neq r} \frac{1}{2} C_{ir} + \left( S_r - \sum_{i \neq r} C_{ir} S_r \right) \right] |\mathcal{M}_{m+2}^{(0)}(p_i, p_r, \dots)|^2$$

has the same singular behaviour as SME, and is free of double subtractions

$$C_{ir}(1 - A_1) |\mathcal{M}_{m+1}^{(0)}|^2 = 0 \quad S_r(1 - A_1) |\mathcal{M}_{m+1}^{(0)}|^2 = 0$$

contains spurious singularities when parton  $s \neq r$  becomes unresolved, but they are screened by  $J_m$

# NNLO cross sections

## Sector decomposition

Denner Roth 1996; Binoth Heinrich 2000  
Anastasiou, Melnikov, Petriello 2003

- ↑ the only method which, so far, yields useful NNLO cross sections
- ↑ cancellation of divergences is performed numerically
- ↓ process dependent

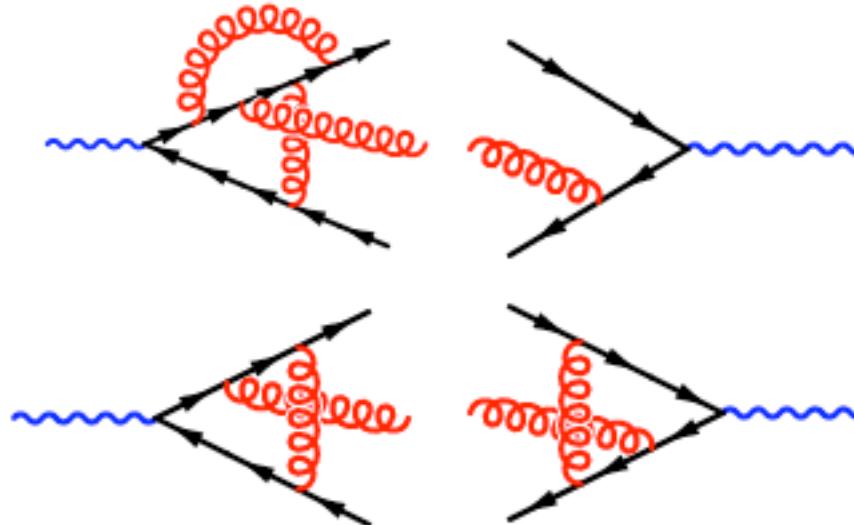

## Subtraction

- ↑ process independent
- ↓ cancellation of divergences is semi-analytic

- several ideas and works in progress

D. Kosower; S. Weinzierl; the Gehrmanns & G. Heinrich 2003  
S. Frixione M. Grazzini 2004; G. Somogyi Z. TrocsanyiVDD 2005

- but completely figured out only for  $e^+e^- \rightarrow 3 \text{ jets}$

the Gehrmanns & N. Glover 2005

# NNLO subtraction

$$\sigma^{\text{NNLO}} = \int_{m+2} d\sigma_{m+2}^{\text{RR}} J_{m+2} + \int_{m+1} d\sigma_{m+1}^{\text{RV}} J_{m+1} + \int_m d\sigma_m^{\text{VV}} J_m$$

the 3 terms on the rhs are divergent in  $d=4$   
use universal IR structure to subtract divergences

$$\sigma^{\text{NNLO}} = \int_{m+2} \left[ d\sigma_{m+2}^{\text{RR}} J_{m+2} - d\sigma_{m+2}^{\text{RR,A}_2} J_m \right]$$

takes care of doubly-unresolved regions,  
but still divergent in singly-unresolved ones

$$+ \int_{m+1} \left[ d\sigma_{m+1}^{\text{RV}} J_{m+1} - d\sigma_{m+1}^{\text{RV,A}_1} J_m \right]$$

still contains  $1/\epsilon$  poles in regions away from 1-parton IR regions

$$+ \int_m \left[ d\sigma_m^{\text{VV}} + \int_2 d\sigma_{m+2}^{\text{RR,A}_2} + \int_1 d\sigma_{m+1}^{\text{RV,A}_1} \right] J_m$$

# NNLO counterterm

construct the 2-unresolved-parton counterterm using the IR currents

$$\begin{aligned}
 A_2 |\mathcal{M}_{m+2}^{(0)}|^2 = & \sum_r \sum_{s \neq r} \left\{ \sum_{i \neq r,s} \left[ \frac{1}{6} C_{irs} + \sum_{j \neq i,r,s} \frac{1}{8} C_{ir;js} + \frac{1}{2} S_{rs} \right. \right. \\
 & + \frac{1}{2} \left( CS_{ir;s} - C_{irs} CS_{ir;s} - \sum_{j \neq i,r,s} C_{ir;js} CS_{ir;s} \right) \left. \right] \\
 & - \sum_{i \neq r,s} \left[ CS_{ir;s} S_{rs} + C_{irs} \left( \frac{1}{2} S_{rs} - CS_{ir;s} S_{rs} \right) \right. \\
 & \left. \left. + \sum_{j \neq i,r,s} C_{ir;js} \left( \frac{1}{2} S_{rs} - CS_{ir;s} S_{rs} \right) \right] \right\} |\mathcal{M}_{m+2}^{(0)}|^2
 \end{aligned}$$

G. Somogyi Z. Trocsanyi VDD 2005

performing double and triple subtractions in overlapping regions

$$C_{irs} (1 - A_2) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

$$C_{ir;js} (1 - A_2) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

$$S_{rs} (1 - A_2) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

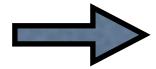

$$CS_{ir;s} (1 - A_2) |\mathcal{M}_{m+2}^{(0)}|^2 = 0$$

needs a **NLO**-type subtraction  
between the  $m+2$ - and the  $m+1$ -parton contributions

$$\sigma^{\text{NNLO}} = \sigma_{\{m+2\}}^{\text{NNLO}} + \sigma_{\{m+1\}}^{\text{NNLO}} + \sigma_{\{m\}}^{\text{NNLO}}$$

$$\sigma_{\{m+2\}}^{\text{NNLO}} = \int_{m+2} \left[ d\sigma_{m+2}^{\text{RR}} J_{m+2} - d\sigma_{m+2}^{\text{RR}, A_2} J_m \right.$$

must be finite in  
the doubly-unresolved regions

$$\left. - d\sigma_{m+2}^{\text{RR}, A_1} J_{m+1} + d\sigma_{m+2}^{\text{RR}, A_{12}} J_m \right]_{d=4}$$

G. Somogyi Z. Trocsanyi VDD 2005

$A_1$  takes care of the singly-unresolved regions and  $A_{12}$  of the over-subtracting

$$\sigma_{\{m+1\}}^{\text{NNLO}} = \int_{m+1} \left[ d\sigma_{m+1}^{\text{RV}} J_{m+1} - d\sigma_{m+1}^{\text{RV}, A_1} J_m \right. \\ \left. + \int_1 \left( d\sigma_{m+2}^{\text{RR}, A_1} J_{m+1} - d\sigma_{m+2}^{\text{RR}, A_{12}} J_m \right) \right]_{d=4}$$

$$\sigma_{\{m\}}^{\text{NNLO}} = \int_m \left[ d\sigma_m^{\text{VV}} + \int_2 d\sigma_{m+2}^{\text{RR}, A_2} + \int_1 d\sigma_{m+1}^{\text{RV}, A_1} \right]_{d=4} J_m$$

need to construct  $\mathbf{A}_{12}$  such that all overlapping regions in 1-parton and 2-parton IR phase space regions are counted only once

$$\mathbf{C}_{ir}(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{C}_{ir}|\mathcal{M}_{m+2}^{(0)}|^2$$

$$\mathbf{S}_r(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{S}_r|\mathcal{M}_{m+2}^{(0)}|^2$$

$$\mathbf{C}_{irs}(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{C}_{irs}|\mathcal{M}_{m+2}^{(0)}|^2$$

$$\mathbf{C}_{ir;js}(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{C}_{ir;js}|\mathcal{M}_{m+2}^{(0)}|^2$$

$$\mathbf{CS}_{ir;s}(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{CS}_{ir;s}|\mathcal{M}_{m+2}^{(0)}|^2$$

$$\mathbf{S}_{rs}(\mathbf{A}_1 + \mathbf{A}_2 - \mathbf{A}_{12})|\mathcal{M}_{m+2}^{(0)}|^2 = \mathbf{S}_{rs}|\mathcal{M}_{m+2}^{(0)}|^2$$

the definition of  $\mathbf{A}_{12}$  is rather simple

$$\mathbf{A}_{12}|\mathcal{M}_{m+2}^{(0)}|^2 \equiv \mathbf{A}_1 \mathbf{A}_2 |\mathcal{M}_{m+2}^{(0)}|^2$$

but showing that it has the right properties is non trivial, and requires considering iterated singly-unresolved limits and strongly-ordered doubly-unresolved limits

# Conclusions

- in the last few years, a lot of progress on the computation of **NNLO** cross sections
- sector decomposition is already up and running
- subtraction is making substantial progress
